Tangential-, radial-, axial blowers
Hot air blowers
Pumps

Catalogue 2009
General information
- Company profile: ebm-papst
- Our keys to success
- Technical introduction
- Type code, glossary

Tangential blowers
- With AC motor
- Double housing version
- Humidity protected
- With EC motor
- Double housing with EC motor

Radial blowers AC
- Motor directly mounted
- High temperature version
- For extractor hoods

Radial blowers EC
- With internal-rotor motor
- With external-rotor motor
- Interfaces
- Additional electronics

Hot air blowers
- RRL series
- R2A series
- R2K series
- R2E, R2D series

Axial blowers
- NoFrost AC design
- NoFrost EC design
- AC motor with impeller Ø 80 - 175 mm

Pumps
- Submersible circulation pumps
- Dosing pumps

Customized products

Addresses
The entire scope of air and drive technology: this is the world of ebm-papst. Originating from the companies ebm, PAPST and mvi, all three rich in tradition, ebm-papst has at its disposal a unique range of products that makes us world market leader. We unite the fortes of three remarkable companies – each of them having worked hard to succeed in attaining a leading position in the most diverse fields and segments. More than 9,700 members of staff in Germany and throughout the world develop, produce and distribute our motors and fans. Striving for perfect solutions in applications in the different industries is what determines our daily work. Those who know us know the high standards we apply to our work and our creed: to be as close to our customers as possible and to be simply the best in terms of innovation and reliability.
For years, ebm, PAPST und mvl have been working together hand in hand. For the benefit of our customers, we use the synergy effect generated by our co-operation and the product ranges that complement each other so well. And now, in 2003, we move even closer and document this closeness in a joint public appearance and a joint name: ebm-papst.

We remain the same- only better!!
Though our outward appearance may have changed, our “inner” values remain the same. We still want you to enjoy being close to your established contacts, making their commitment and know-how help you succeed in your specific task. And, of course, we also want you to enjoy the same quality and selection of ebm, PAPST and mvl products:
ebm products are now available from ebm-papst Mulftenge
PAPST products are now available from ebm-papst St. Georgen
mvl are now available from ebm-papst Landshut.

Passionately involved in R&D
Our catalogues just list the results of our incessant efforts in R&D: products of highest quality and reliability. After all, it is our passion to constantly try something new and improve what we have. In doing so, we take advantage of the latest development methods and state-of-the-art technology and invest quite heavily in R&D facilities. Best of all, though: we rely on excellently trained and skilled engineers and technicians to be at your service in R&D and Sales & Distribution.

Producing and safeguarding high-quality products and services
This is our promise that knows no boundaries. Whether we manufacture in our national headquarters or in one of our 17 international production facilities – we insist on the same high level of quality! No cheap compromises when it comes to quality control! And this across all levels of production and throughout all processes: consulting customers, development, material selection through to picking certified, choice sup-pliers and on to the production of parts and final delivery. On top of this, our products have to pass the most rigorous test procedures under all realistic operating conditions: continuous stress test, salt spray test, vibration test, or in the room for precision noise measuring, just to mention a few. And the product gets clearance for serial production only after all the desired characteristics have been determined to be just right.

Environmental care is another priority with ebm-papst. This is why we have developed our product line in EC technology, which makes for very low power consumption, and why we take pride in our manufacturing philosophy. There is absolute focus on environmental care in production, recycling, waste and waste water disposal.

Global Domestic
In order to be specialist for customised solutions throughout the world, you need strong partners. Global Domestic – i.e. being present all over the world and being a national company in each individual country – is how we have established ourselves with our successful subsidiaries in all important markets on this globe. And so you will always find ebm-papst close to home and knowing the demands of your very markets. Besides, our worldwide production alliance serves as a basis for competitive pricing. Our global services and logistic outlets, i.e. IT networking, safeguard short reaction times and just-in-time delivery.

All our efforts are documented in a comprehensive quality management system, both for products and services. Being certified as complying with the tough requirements of the international standards DIN EN ISO 9001:2000, ISO/TS 16949-2 and of standard DIN EN ISO 14001 is just one seal of approval we have got for our incessant strife to provide only the best quality products and services.
Our keys to success

Our innovations and technologies keep on turning into new industrial standards. This competitive capability can only be maintained by seeing ventilation as a whole: the interrelationship between and the system of motor engineering, aerodynamics, and electronics. These are our three core competences, imminently connected and linked in each of our products. And so we handle air intelligently and quietly and continue to set new standards in drive technology. Our system solutions already form the main part of our product range. And they will be the main key to our success.

Motor engineering, aero-dynamics, electronics
Our drive is well known and famous with specialists: our external-rotor motor, which has made us world market leader, quietly, yet powerfully. Being versatile as to integration, it is ideally suited to the most diverse applications. Based on this principle, we here at ebm-papst have developed the widest range of fans and motor types in the world. And for hot or aggressive blower mediums, the internal-rotor motor is the perfect complement.

Also, in drive technology, certain applications simply require the internal-rotor motor principle, and they are then realised with our motors specifically developed for such cases. Take, for instance, the steering support motor in the automotive field developed as innovation in active steering.

When it comes to airflow: this can be engineered, too. Be it axial or centrifugal fans, centrifugal blowers, compact fans or tangential blowers: we always design fan blades, impeller blades and ducted housings with the specific application in mind. We strive to minimise noise and to optimise efficiency. This is the challenge that we have taken up and which we meet working away powerfully and quietly.

Finally, intelligence will become the decisive factor on all markets in future. After all, only in connection with electronics can drive and airflow - as system solution - have an optimal effect in a product or application. Interfaces are avoided, and thus potential faults and failures.

Setting standards with EC technology
Wherever intelligent air handling is required, where energy consumption needs to be reduced and performance has to be maximised, there our EC motors are your reliable answer. They do not waste financial or natural resources. But they boost high efficiency, continuous controllability via analogue or digital inputs, long and maintenance-free service life and robustness.
Without any problems, the ebm-papst EC technology allows you to realise networked, bus-linked appliances, to integrate simple or complex controls at low cost and to also realise time and again new and customised and complete solutions. Here, ebm-papst excels as competent development partner, with our experience of more than 25 years and our excellent know-how in R & D and production also being well documented in a few hundred national and international patents. And there is also our ability to listen intently, to pay good attention to our customers and their demands – in order to come up with new and pioneering ideas, such as:

- EC fan units for clean room technology, where the fan is supplied as fan filter unit. As the electronics are integrated and the unit is wired up completely and ready to plug in, there is no need for our customers to waste time and money on laborious wiring work.
- Sensitive EC sensor fans for the automotive industry providing optimal selection of the air-conditioning unit in the car and, combined with booster blowers, individual air-conditioning of each and every passenger seat.
- EC gas blowers with commutation and control electronics including a processor. They are developed in such a way as to make the blower pre-mix the required amount of air with the gas. Aero-dynamics with these blowers are adjusted in such a way as to make these blowers ideal for use in very limited space at high back pressure.
Technical introduction

The introductory pages preceding the various product groups and the product pages contain specific instructions for and technical information on the relevant products. The following general information applies to the entire range of products.

Electromagnetic compatibility (EMC):

ebm-papst products are components supplied to other industrial and trade companies with expert knowledge of electromagnetic compatibility.

ebm-papst products are therefore not subject to the Law on Electromagnetic Compatibility of Equipment. Compliance with the EMC Directive must be assessed on the final product since different EMC properties may be created when products interact with other components.

ebm-papst AC motors meet the requirements of Low Voltage Directive and EMC Directive. Statutory limit values are being kept.

ebm-papst motors are not safety-relevant components requiring an EMC test by an independent institute. ebm-papst, therefore, does not issue EMC test protocols.

For squirrel-cage induction motors and their connection to mains voltages the “GUIDELINES IN THE APPLICATION OF COUNCIL DIRECTIVE 89/336/EEC OF 3 MAY 1989 ON THE APPROXIMATION OF THE LAWS OF THE MEMBER STATES RELATING TO EMC” apply.

Section 5.4, p.21ff states that compliance with the EMC regulations is generally assumed for induction motors (e.g. shaded pole motors and capacitor motors).

DQS certificate:

The high quality standards in R & D, production and sales are monitored by a quality management system that complies with the tough requirements of DIN EN ISO 9001. ebm-papst Landshut has been certified by DQS since 1991.

Product liability:

ebm-papst motors and blowers are components the function of which is determined in the customer’s unit. ebm-papst offers a warranty for the function of its products according to EN 60335-1, EN 50178 and EN 60950, provided that the ebm-papst products are used correctly and that, during the development of the customer’s product, ebm-papst made sure of this and issued a confirmation in writing as to this effect.

Only after the product has passed product-specific and application-specific tests agreed on between ebm-papst and the customer, can subsequent liability be assumed; this will be done exclusively in accordance with relevant statutory regulations.

Important Information: Fans and motors may only be used after installation and may not be put into operation before being properly installed. Installation has to be effected by trained, briefed and qualified staff.

The information and images in this catalogue are non-binding. We reserve the right to modify our products (deviation from images and technical data provided herein) without prior notice in writing.

</tbody>
</table>
The small ratio of the impeller diameter (30 to 65 mm) to the impeller length in most cases allow a flat and stretched design. The large cross section on the suction and pressure side makes for high air delivery at low flow rates. The air being thrown a long distance and low noise level are additional features of tangential blowers.
Vortex stream through tangential blower

Mounting conditions for QL 4 series
- air sucked in from top, covered backside
- air sucked in from the back, covered topside
- air sucked in from top and back

Mounting conditions on pressure side QL 3, QLK, QLZ, QLN
- functional
- non functional

Mounting conditions on suction side QL 3, QLK, QLZ, QLN
- functional
- non functional

Separation of suction and pressure area
- functional
- non functional
Tangential blowers
QL 3

- impeller diameter 30 mm
- mounting position horizontal or vertical with motor at the bottom
- permissible ambient temperature 0 - 60°C
- insulation class B, class F or H on request

suitable for connector Molex Mini-Fit, Jr. (not part of delivery)
connector: order number 39-01-4050
female terminal: for example 39-00-0059
Tangential blowers with electronically commutated EC-motors.

- integrated electronics
- blower speed variable via PMW (pulse width modulation) signal, optionally speed adjustment via 0 - 10 V analogous voltage signal
- impeller diameter 65 mm
- horizontal or vertical mounting position with motor at the bottom
- protection class IP20, insulation class F
- permissible ambient temperature 0 – 60 °C

</tr>
</tbody>
</table>
Radial blowers with AC internal-rotor motor

Radial blowers RL with forward curved impellers (drum impellers) feature high specific ratings at high maximum pressure, stable pressure/air flow characteristic curves, good efficiency and low noise levels. Both single and dual inlet versions are available, as are blowers with double housing. The motors are mounted outside the air current on the blower housing itself.

For increased requirements in terms of temperature resistance, e.g. for use as flue gas blowers in gas heating appliances, the motors are thermally and acoustically decoupled from the blower unit using silicon elements. A cooling vane on the motor shaft between the blower housing and the motor also reduces the temperatures transferred to the bearing system through the shaft. In conjunction with bearing systems suitable for high temperatures and a coil structure that complies with insulation class H, this means that all specific requirements for medium temperatures of between 180°C and 250°C can be met according to the design.

As a result of the elastic motor mounting, the mass of the motor must be supported depending on its mounting position. Therefore, it is essential that details of the mounting position are given.

Intake nozzles, guard grilles, pressure sensors, tachometers and other accessories can be supplied to adjust the units to suit specific requirements in heating systems.

The signal transmitter SG2 is an impulse transmitter suitable to be connected to EM30 and KM motors. 12 square impulses per rotation of the motor shaft are formed by means of a 24-pole, plastic-bonded ferrite magnet ring, in connection with a Hall-IC. A secondary electronic system can be applied to use this signal as speed recognition, speed control.

In a simple case, a supply voltage of 4.5 - 24 Volts as well as a pull-up resistor of e.g. 2.7 kΩ and 0.25W is necessary to obtain a digital signal of equal amplitude at the output. Features of the signal transmitter are high operating reliability, small Dimensions, no limitation to build-in position and no operating noise.

ebm-papst · Landshut
Radial blowers, dual inlet, with external-rotor motor made by ebm-papst Mulfingen are available in special range hood design. The blowers listed on the following pages are mainly used in so-called wall and island chimneys as well as in built-in hoods fitted with a blower module.

The blower range is extremely low in noise, even with high air performance. Another great advantage lies in the fact that this blower range is very easy to install. The dual inlet blower can be mounted in the customer’s appliance in no time at all. Exhaust air pipes and bushing nozzles can be fitted without any problems.

The capacitor is part of the integrated terminal box for blower sizes Ø140 to Ø160 mm. The blower is also completely wired up and ready to be line-operated via a plug. The standard design comes in 4 speed steps, thus covering a wide range of possible applications.

ebm-papst Mulfingen also offer an extensive range of products, i.e. adapted fans and blowers, for other designs and types, e.g. flat screen hoods, intermediate or substructure hood. Please contact us for more information.

**General information**

- **Radial blowers**
- **Hot Air blowers**
- **Axial blowers**
- **Pumps**
- **Addresses**

---

**Image Description:**

- A radial blower with an EC motor, featuring a motor rotor and electronic components, indicating advanced technology and possibly high efficiency and energy savings.
Controllable blowers with steep pressure/air flow characteristics curves and high maximum pressure are required to provide optimal fuel/air mixture and volume for modern gas or oil-fired heating boilers that operate in modulating mode, and also for gas technology in every operating status and external condition.

ebm-papst has played a decisive part in the development of EC blowers suited to this purpose and can, today, offer the most extensive range of blowers for this field of application. The special features of these blowers can, however, also be used in a wide range of other applications.

**Drive unit:**
Brushless DC-motors with integrated electronics.
Series RG, RLB, RLS: internal-rotor design
Insulation class F (EN60335-1)
Series G1G/G3G: external-rotor design
Insulation class F (EN60335-1)
The motor is anti-vibration mounted to minimise structure-borne noise.

**Protection type:**
IP20 with cover depending on mounting position

**Protection class:**
The motors comply with the requirements for protection class III. At rated voltages of over 42 V, therefore, a potential separation is provided for between the voltage supply to the motor and the interface to the control module and, commensurate with the requirements on greater insulation, creepage distances and clearances of 8mm are also provided for. Protection class III then only applies to the signal plug.
The blower complies with protection class I.

**Housing:**
NRG, RG and G1G/G3G: Die-cast aluminium
RLB120: Galvanised sheet steel
HRG 134, RLS170: Plastic PA6 GF
The air tightness required for gas pre-mixing is achieved by sealing the two casing shells and the passage hole of the drive shaft. When using blowers for such applications, special criteria, testing and approvals have to be asserted with the customer. Safety tests (gas tightness etc.) for the complete system have to be carried out by the customer and are his responsibility.

**Blower impellers:**
HRG, NRG, RG, G1G126/144:
Material: Plastic, anti-static, resistant to pentane, surface resistance <10⁹, dynamically fine-balanced.
RLB120: galvanised sheet steel
RLS170: plastic PA6 GF
G1G170, G3G200, G3G250: sheet aluminium

**Bearings:**
Maintenance-free ball bearings covered on both sides. Calculated service life expectation L₁₀ 40,000 hours of operation at an ambient temperature of 40°C, horizontal mounting position and typical operating conditions.
Closed-/Open-loop speed control:
The blower speed can be adjusted over a wide range using a PWM (pulse width modulation) signal. The PWM signal is a rectangular signal, preferably with constant frequency and variable pulse width. It is activated by an open collector drive and a pull-up resistor. Blowers G1G170, G3G200, G3G250 are also available with 0-10V control input. An additional electronic system is available as an option, to convert an analog voltage signal of 0 – 10 V into the required PWM signal. In addition, there is another electronic system which allows to activate two speeds, preset with potentiometers, via a control input. (see page 75)

Interference suppression/EMC:
EMC according to EN 55011

Mounting positions:
1                  2                 3

Mounting positions 1 – 4 are possible. If the motor is installed on anti-vibration mounts, the motor mass is given additional support by an elastic element. Details of the mounting position must therefore be provided. Consultation is indispensable for installation positions 5 and 6.

Pressure relief:
Apertures for pressure relief on request.

Commutation electronics:
Motor electronics integrated in the blower unit, with start-up current limit and reverse battery protection using plug coding, locked-rotor protection and overload protection optional. See separate drawings for details of interface requirements. Adaption to the boiler control is required in specific cases.

Speed recognition:
Hall IC signal output (2 pulses per revolution).
G1G170, G3G200, G3G250:
3 Impulse je Umdrehung
G3G250-MW: 5 Impulse je Umdrehung
The derivative feedback is galvanically decoupled with motors on mains voltage operation.
Radial blowers with EC internal-rotor motor

**Characteristic curves**

Nominal operation (230 V, 100% PWM) permissible only as of minimal back pressure of 500Pa.
Additional electronics for EC motors BG20 and BG36 is usually realized via digital PWM-signal. Two additional electronics are available:
1. To convert an analog voltage signal of 0-10 V into the required PWM signal
2. To activate two speeds, preset with potentiometers, via control input

Additional electronics with analog input 0-10 VDC

Additional electronics for 2-speed operation
Radial blowers with EC external-rotor motor

G1G126 – 24 VDC

material
– housing: aluminium
– impeller: plastic PA 6
– cover: plastic PP30TV

interface
– see page 86, interface no. 3

premix
– If gas needs to be premixed in the blower, then a special blower will have to be used. For further details, please contact us.

Hot air blowers

Hot air circulation blowers are designed for the special requirements in circulating hot air, e.g. in ovens, climate cabinets, sterilisation units, meal and dish warmers and similar appliances.

The basic design comprises a shaded pole motor mounted outside the hot area using special mounting plates and a radial impeller made of FAL sheet steel, stainless steel or die-cast aluminium, which operates within the high temperature zone.

Equipment for generating hot air is not supplied by ebm-papst and may, e.g., take the form of a ring heater mounted around the hot air impeller.

Depending on the type or requirements, sintered sleeve bearings with high temperature-resistant lubricant or ball bearings may be used.

The maximum permissible bearing temperature is 120°C.

Versions with sleeve bearings may only be used with a horizontal shaft, but any shaft position is possible if ball bearings are used.

The winding complies with insulation class H (EN60335).

Depending on the measures taken for thermal insulation between motor and impeller and the impeller material, circulation temperatures of up to approx. 250°C, temporarily even up to 500°C (e.g. for pyrolytic self-cleaning processes in ovens) can be managed.

The standard types described below are only a selection taken from the wide range of possibilities. The circulation capacities they can achieve depend to a large extent, on the mounting situations, i.e. the specified values for air flow, pressure and speed are only general benchmark figures in typical mounting conditions.

For serial use, motor rating, mounting, shaft length and impeller can be adjusted to suit specific requirements.
Hot air blowers
RRL 120, RRL 140

- sintered sleeve bearings with additional lubricant depot for bearing temperature up to max. 120 °C
- mounting position: horizontal shaft
- insulation class H (EN 60335)
- impeller: FAL sheet steel

- AC-Motor with impeller Ø 80 - 175 mm
Axial blowers AC, NoFrost design
EM2513LN

Circulation blowers are required in chest and upright freezers with automatic defrost function ("NoFrost" technology) as well as in chiller compartments in refrigerators. In these appliances, blowers must meet special requirements:
- Low power input for placing the appliance in low energy efficiency classes
- Long service life as a result of the long periods which they are switched on
- Resistance of the winding, bearing systems and the electronics in temperatures of as low as -40° C and relative humidity values of up to 95%
- Low noise to comply with maximum demands as to comfort.

Shaded pole motors of the EM21, EM25 and EM30 series can be combined with axial plastic impellers. For standard applications, this makes for low cost, powerful solutions. The suitable motor/impeller combination depends on the technical requirements and must be determined in each case.

For better efficiency, the preferred direction of air flow should be blowing over motor.

Submersible circulation pumps
P2E 070 – with stirring propeller

- for circulation or pumping of water or similar liquids
- pump housing, pump impeller, crosshead connecting and covers made of fibre-glass reinforced plastic, stirring propeller made of PE
- top mounted external-rotor motor, vacuum-encapsulated stator, varnished in black, protected against accidental contact underneath plastic cover and with shaft of stainless steel
- all screws in stainless steel
- capacitor integrated in plastic terminal box and wired up ready for plug-in
- mounting position: vertical
- insulation class B
- type of protection: IP44 when installed (final evaluation to be carried out in customer application)

Customized products

For small to medium-scale serial production, motor and fan components can be modified to create a product tailored to a particular application. With motors, there is the option of different inductions, insulating systems, bearing systems, shaft dimensions, mounting configurations. Additional components like speedometer, brake, cooling blade can be added. Blowers can be adapted to special requirements on their scroll or impeller by applying special materials, balancing, coating, elastic motor suspension. Special components can be added on inlet or outlet side in order to meet the requirement of the individual application.

With relevant demand, we gladly develop new products and complete solutions for your specific problems. Please contact us for further details.
