With its completely revised range of drive engineering solutions, ebm-papst, the innovation leader in the world of air technology and drive engineering, is once again demonstrating the concentrated competence of a powerful group. The new complete motors catalogue 2011 offers a comprehensive range on 164 pages. In the power range from 1 – 2000 W, there are drive solutions for a wide range of different requirements.

Besides the proven drive systems in AC and DC technology, several lines of electronically commutated direct current motors (BLDC) form the core of the overall range. Building on the future-oriented, ecologically aligned GreenTech EC technology, these motors satisfy today the efficiency requirements of tomorrow. It doesn't matter whether these are flexible and dynamic internal rotor drive systems from the modular system of the ECI 63 series or the high-performance external rotor drives of the VarioDrive C line. All of them combine the quality and experienced engineering of a powerful brand. So: full steam ahead for applications featuring these new drives, for example in industrial automation, intralogistics, medical and laboratory technology, heating engineering or as special fan drives.

And even if the drive solution you are looking for cannot be found directly in the comprehensive standard catalogue, the application experts from ebm-papst are there with help and advice to examine all options for adapting existing solutions.
