Farmington (CT), St. Georgen, November 2010

The American subsidiary of ebm-papst which is located in Farmington, Connecticut – ebm-papst Inc. – is proud to announce the acceptance of the award for Best Infrastructure Product at the 2010 Advanced TCA Summit.

ebm-papst granted the award for the newly designed extension of its S-Force line, 2200 FTD series compact fan produces 30% higher airflow, a 65% higher cooling density and is 27% thinner than comparable 200mm fans currently available on the market. Because the structural dimensions feature a compact flat design, a reliable cooling solution can easily be implemented within AdvancedTCA racks, thus freeing space for additional components. The 2200 FTD keeps momentum with the demands placed upon design engineers and AdvancedTCA requirements while maintaining ease of use and reliability through its integrated speed controlled motors designed to minimize the heat dissipation with up to 90% efficiency. The 2200 FTD compact fan exceeds present ATCA system coolings, and they do so quietly and efficiently with running times of 70,000 hours or more.
