Specifications for safety testing

Insofar as they apply to the installation/machine supplied, performance of the following tests is mandatory:

- 1. Initial electrical testing in accordance with VDE 0113-1 (DIN EN ISO 60204) and VDE 0100-600
 - \rightarrow A detailed list of the measurements to be taken is given in the annex.
- Initial inspection and initial testing of electro-sensitive protective equipment in accordance with DIN EN 62046 / VDE 0113-211 / Provision on Operating Safety (BetrSichV)
 - → Stopping performance is to be measured in accordance with DIN EN ISO 13855.
- 3. Checking of ESD capability in accordance with DIN EN ISO 61340-5-1
 - → The discharge resistances of setting-down surfaces and the field strengths of individual insulators are to be measured
- 4. Testing of the closing force of power-operated guards in accordance with DIN EN ISO 14120
 - → The actual closing force is to be measured.

All measurements are to be taken by a person qualified to perform the corresponding test.

Use is to be made of measuring instruments that comply with the applicable standards.

All tests are to be documented with the corresponding measured values and submitted to ebm-papst on acceptance of the installation/machine.

If the installation/machine is fully or partially disassembled for transportation, renewed testing (item 1) must be performed at the assembly location.

ebmpapst

Annex to item 1

The measurement protocol to be supplied must list all the measurements performed (measurement points), as well as the reference point for each measurement.

The following measurements are to be performed:

- 1. <u>Low-resistance measurement (protective earth resistance, equipotential bonding)</u> <u>in accordance with VDE 0113-1/18.2.2</u> Test current: min.10 A
- 2. <u>Insulation resistance measurement in accordance with VDE 0113-1/18.3</u> Measurements are to be taken on all the conductors of the main circuit.
- 3. <u>Voltage measurement (HV) in accordance with VDE 0113-1/18.4</u> Measurements are to be taken on all the conductors of the main circuit. Assemblies and devices not designed to withstand this test and overvoltage protectors that would probably be triggered during measurement were disconnected before the test. Assemblies and devices subjected to voltage testing on the basis of the applicable product standards can be disconnected during the test.
- 4. Leakage current measurement

Measurement method: Measurement of current difference between phase and neutral conductors. True RMS measurement.

In the case of measured values ≥10 mA TRMS, a connection is to be provided for additional equipotential bonding on or in the switch cabinet.

- 5. <u>Ground fault loop impedance and system impedance measurement</u>
 - in accordance with VDE 0100-600

Measurements are to be taken on all protected current paths of the main circuit. At the connection furthest away in each case.

The reference value of the connection point during the measurement is also to be documented.

6. <u>Residual voltage measurement in accordance with VDE 0113-1/6.2.4</u> If a hazardous residual voltage still remains after the corresponding decay time, this is to be clearly

If a hazardous residual voltage still remains after the corresponding decay time, this is to be clearly marked on the switch cabinet.

7. RCD measurement in accordance with VDE 0100-600

Measurements are to be taken with the corresponding tripping currents depending on the type of RCD.

The ebm-papst Mulfingen internal test log is appended to this document. It can be used as a specimen log. Usage is <u>not</u> obligatory!

This test log confirms the proper performance of all tests prescribed within the scope of the quoted standards on acceptance of the above-mentioned electrical machine / installation.

Testing was performed by a qualified person meeting the requirements as per DIN VDE 0105 Part 1/5.75, item 3.2.1.

The machine/installation tested meets the requirements of DIN VDE 0113/EN 60204-1/IEC 204-1 in every respect.

engineering a better life

Annex 2 Initial inspection and testing of electro-sensitive protective equipment

Initial inspection and testing of electro-sensitive protective equipment in accordance with DIN EN 62046 / VDE 0113-211 / DIN EN ISO 13855 / Provision on Operating Safety (BetrSichV)

□ Initial inspection and testing successful □ Initial inspection and testing <u>not</u> successful

The test only relates to proper functioning, fitting and incorporation of the electro-sensitive protective equipment into the control system. It is not a substitute for machine safety testing. Modifications to the electro-sensitive protective equipment or the machine/installation render this initial inspection and test invalid. The initial inspection and test must then be repeated.

3.4. Measuring field strength of insulators:

Measuring instrument used:

Manufacturer:	
Туре:	
Serial no.:	
Last calibration:	

Before the start of measurement, equipotential bonding (protective earth) was connected to the connection socket of the measuring instrument

Limit value:

50V for every cm from ESD-sensitive component/unit

	Number of measurement performed:				
No.	Measurement point	Distance from component in cm	Measured value in V	Asses OK	sment Not OK

Annex 4 Power-operated guards

Testing of power-operated guards in accordance with DIN EN ISO 14120 / DIN EN 12453

Details of test object					
Machine:		Year of manufacture:			
Manufacturer:		Installation number:			
Place of testing:		Inventory number:			
General comments	3:	Order number:			

4.

4.1. Visual inspection:

OK	Not OK	Not applicable	Remark	
				No dangerous crushing points
				Adjusters (pressure regulator etc.) secured against manipulation

Comments:		

4.2. Measuring closing force:

Protective device does not open automatically upon contact with a person or object.

Measuring instrument used:

Manufacturer:	
Туре:	
Serial no.:	
Last calibration:	

Measured closing force (in Newton): Ν

Assessment:

Maximum closing force as per DIN EN ISO 14120 may not exceed 75N.

Protective device opens automatically upon contact with a person or an object.

Measuring instrument used:

Measuring instrument used:	Manufacturer:	
	Туре:	
	Serial no.:	
	Last calibration:	
Measured closing force (in Newton):		_ N
Measured existing closing force remains in force:] longer] less than 0.75 seconds
Closing force goes down to <25N in 5 seconds:] Yes] No
Assessment:		

Maximum closing force as per DIN EN ISO 12453 (see table) This maximum value as defined in table may only persist for max. 0.75s (= Td). After Td has elapsed, no force <150N is permitted. This force must go down to <25N after no longer than 5 seconds.

Table A.1 - Permissible impact forces			
Permissible impact forces	Between both	Between level surfaces	
	In opening widths from 50 mm to 500 mm	in opening widths > 500 mm	edges > 0.1 m ² with no side length < 100 mm
Horizontally-moved door	400 N	1 400 N	1 400 N
Door turning around axis vertically to floor	400 N	1 400 N	1 400 N
Vertically-moved door	400 N	400 N	1 400 N
Door turning around an axis parallel to floor - 400 N Barriers		400 N	1 400 N
