

ebm-papst at SPS 2022

Innovative solutions for automation

The SPS – Smart Production Solutions – trade fair is one of the most important automation trade fairs and will be held in Nuremberg, Germany from 08 - 10 November 2022. ebm-papst will be presenting smart and innovative solutions for drive and ventilation technology in Hall 1 at Stand 1-324.

Pioneering drive technology with industrial Ethernet technology

At SPS, ebm-papst will be unveiling ECI-63 internal rotor motors from its modular drive system that have been fitted with an EtherCAT interface. EtherCAT combines the advantages of Ethernet-based communication with the simplicity of classic fieldbus systems, thereby avoiding complex IT solutions. Within the ECI series, drives with integrated BUS interface have already been established for some time under the term 'K5 electronic functionality'. Now the internal rotor motors can also be addressed via EtherCAT. To achieve this, high-performance interface electronics including a multi-protocol chip have been added to the drive housing. The advantages for decentralized drives lie primarily in the synchronization of several axes, the reduced time and effort required for integration, and a space-saving design within the machine.

RadiPac for greater power and efficiency

With the new RadiPac series, ebm-papst has succeeded in significantly improving existing centrifugal fans yet again: they operate with significantly higher efficiency levels and higher speeds ensure more air flow and higher pressures, meaning that even high-pressure applications can be covered. The impeller developed according to the latest aerodynamic findings drastically reduces flow losses and further decreases the noise levels. To accommodate different installation situations, the RadiPac series is available in a standard and a short version. Both versions are available as a motor-impeller combination or as a ready-to-install plug & play solution with support bracket.

DiaForce increases cooling capacity by 50%

The digital world is developing at rapid pace. Electronics are becoming more powerful and more densely packed. This poses challenges for electronics cooling. The DiaForce diagonal compact fan with integrated DC motor enables 50 percent more air performance with 6 dB(A) less noise. Its concept for success lies in the geometry of the impeller and housing, with characteristics that fall between those of an axial fan and a centrifugal fan. With the DiaForce diagonal compact fan, air is drawn in and blown out in an axial direction. Its geometry can reduce turbulence and increase pressure buildup. These performance features mean that the DiaForce can already meet the future requirements of electronics cooling. Possible application areas include data centers or base stations for mobile communications, autonomous driving, or artificial intelligence.

About ebm-papst

The ebm-papst Group, a family-run company headquartered in Mulfingen/Germany, is the world's leading manufacturer of fans and drives. Since the technology company was founded in 1963, it has continuously set the global industry standard with its core competences in motor technology, electronics, digitization and aerodynamics. With over 20,000 products in its portfolio, ebm-papst provides the best energy-efficient, intelligent solution for virtually every ventilation or drive-engineering task.

In fiscal year 2021/22, the "hidden champion" generated revenues of € 2,288 billion. The group employs roughly 15,000 people at 29 production sites (in Germany, China and the USA, to name but a few) and in 51 sales offices worldwide. ebm-papst sets the benchmark with their fan and drive solutions which are used in almost all industries, such as ventilation, air conditioning and refrigeration, heating, automotive, information technology, mechanical engineering, household appliances, intralogistics and medical engineering.
