Compact fans for AC, DC and EC

Version 2019-04
Trendsetter in fan technology

Among the best.
Trendsetting with innovative technologies. Listening to customers’ needs. Developing new ideas to meet requirements and realizing them with pioneering spirit. This philosophy has made ebm-papst the leading technology pioneer in the world of fans.

A brand in that decades of application expertise gained from large-volume fan production and because we are in a position to produce highly efficient quality products. Our intelligent solutions for electronics cooling make sure that you are always one step ahead of the competition thanks to innovative, reliable, top-quality technology. Of course they are readily available at fair market prices.

And if required, tailor-made right down to the last detail. In other words, if you need fans that do not yet actually exist, contact us.

Insist on ebm-papst.

## Agents worldwide
As technological leader for ventilation and drive engineering, ebm-papst is in demand as an engineering partner in many industries. With over 20,000 different products, we provide the right solution for just about any challenge. Our fans and drives are reliable, quiet and energy-efficient.

Six reasons that make us the ideal partner:

Our systems expertise.
You want the best solution for every project. The interrelationships between ventilation and drive engineering must thus be considered as a whole. And that’s what we do – with motor technology that sets standards, sophisticated electronics and aerodynamic designs – all from a single source and perfectly matched. These system solutions release unique synergies worldwide. And in particular – they relieve you of a lot of work, so that you can concentrate on your core competency.

The ebm-papst spirit of invention.
In addition to our wide range of products, we are always able to develop customized solutions for you. A diversified team of 600 engineers and technicians works at our three locations in Germany: Mulfingen, Landshut and St. Georgen. Contact us to discuss your next project.

Our lead in technology.
As pioneer and trail-blazer for developing highly efficient EC technology, we are way ahead of other motor manufacturers. Almost all our products are also available with GreenTech EC technology. The list of benefits is long: higher efficiency, maintenance-free, longer service life, sound reduction, intelligent control characteristics and unrivalled energy efficiency with savings of up to 80 % compared to conventional AC technology. Let our technology be your competitive advantage as you lead in your industry.

Closeness to our customers.
ebm-papst has 25 production locations worldwide (including facilities in Germany, China and the USA), together with 49 sales offices, each of which has a dense network of sales representatives. You will always have a local contact, someone who speaks your language and knows your market.

Our standard of quality.
Of course you can rely on the highest standards of quality with our products. Our quality management is uncompromising, at every step in every process. This is underscored by our certification according to international standards including DIN EN ISO 9001 and DIN EN ISO 14001.

Our sustainable approach.
Assuming responsibility for the environment, for our employees and for society is an integral part of our corporate philosophy. We develop products with an eye to maximum environmental compatibility, in particular resource-preserving production methods. We promote environmental awareness among our young staff and are actively involved in sports, culture and education. That’s what makes us a leading company – and an ideal partner for you.
The story of our success to market and technology pioneer.

1963  Founding of Elektrobau Mulfingen GmbH & Co. KG by Gerhard Sturm and Heinz Ziehl.
1965  First tube axial fan developed in EC/DC technology.
1966  ebm-papst’s success takes off with the new 68 motor.
1972  The first ebm-papst foreign subsidiary is established in Sweden.
1988  Gerhard Sturm is awarded the Federal Cross of Merit.
1990  The sixty-millionth external-rotor fan is produced.
1992  Acquisition of PAPST Motoren GmbH in St. Georgen.
1997  Buyout of the Landshut (mvl) plant.
1998  Development of first fans with integrated electronics.
2003  Change of name to ebm-papst.
2008  The HyBlade® range of fans sets new efficiency standards.
2010  GreenTech – our sign for energy efficiency and resource preservation.
2011  RadiCal defines a new standard for EC centrifugal fans.
2013  ebm-papst takes over the gearbox specialist Zeitlauf and wins the German Sustainability Award.
2014  Team partnership with Mercedes AMG PETRONAS Formula 1 team.
2015  RadiPac pushes the limits of efficiency.
2016  S-Panther – the consistent development of the S-Forces series.
Drive know-how
For the past 60 years, all conceivable types and applications of drive engineering have played an essential role at ebm-papst. A commitment that is the foundation for the development of optimum drive solutions regardless of the type of fan and its use. DC and EC fans are generally equipped with electronically commutated external rotor motors. In order to save as much space as possible, commutation electronic components are integrated in the hub of the fan. Our AC fans are driven mainly by shaded-pole or capacitor motors based on the external rotor principle. In the 3900 and 9900 range of particularly slim fans, internal rotor motors are used.

Smooth operation
Our aerodynamically optimized design and high mechanical precision produces outstanding noise properties in series production. The “soft” commutation electronics of DC and EC fans produce a very smooth operation. By avoiding steep switching edges when the individual coils are switched, this reduces the structure-borne noise from the motor. Computer-aided measurements and series of analyses performed in a state-of-the-art sound measuring chamber are conducted on each fan model from the very beginning.

Long service life
The bearing system plays a vital role both in the long service life and the smooth operation of device fans. The Sintec compact bearing provides most of the device fans with a proven bearing system. Constant low noise during the entire operating time and considerably lower shock sensitivity are the outstanding features of this bearing technology. In addition, with regard to temperature endurance, Sintec compact bearings can be used without problems in most applications. Despite the slightly greater noise and shock sensitivity of ball bearings, this bearing technology should be given preference for fans exposed to extreme thermal and adverse application conditions (e.g. extreme environmental conditions, critical installation position, etc.). The service life data provided in this catalog is based on extensive service life tests and mathematically / scientifically proven service life calculations. Our product descriptions are updated continuously with all relevant data obtained from long-term tests.
Aerodynamics
With the aid of state-of-the-art computer programs, we are able to optimize the fan impellers and the inner shape of the housing. Air output and available motor performance are matched exactly to the size of fan. This guarantees the low noise that is typical for ebm-papst, even at high back pressure.

Sturdy construction – in metal or plastic
Fans of all-metal construction: sturdy and resistant. The housing is made of an aluminum alloy. The metal surfaces that are subject to corrosion are permanently protected by an impact- and abrasion-resistant electrophoretic baked enamel. This particular version is very recyclable. Fans with fiberglass-reinforced plastic housing and impeller: Excellent stability and low weight distinguish this highly efficient fan design. Combinations of metal housing and plastic impeller combine the advantages of both types of design.

Product images
The dimensioned drawings and product photos that appear in the catalog are for orientation purposes and may differ in some details from the actual product design.

Product liability
Motors and fans from ebm-papst are components intended for proper installation. The customer bears responsibility for the overall end product.

Brand name PAPST
The PAPST mark is a registered brandmark for ebm-papst products and is a synonym for compact fans of the highest quality, functionality and reliability for decades.

Safety is included
It goes without saying that all ebm-papst fans conform to the approval requirements of the VDE (Association of German Electrical Engineers) and the standards and regulations of UL and CSA. All fans conform to the European Standard EN 60335 or EN 60950 plus those of the UL (Underwriters Laboratories) and CSA (Canadian Standards Association). With few exceptions, our DC fans are designed to meet the requirements of protection class 3 / protection class voltage. AC fans for protection class 1. ebm-papst fans meet the highest requirements of electrical safety. All design variants feature reverse polarity and locked-rotor protection.

Quality in detail
It is the important details that reveal the meaning of the words “made by ebm-papst”: Consistent adherence to development and design processes and a goal-oriented commitment to quality along the entire process chain are the foundation for the above-average service life of our fans. 100,000 hours and above are no longer an exception. The no-compromise ebm-papst quality assurance spans over all process levels – from the choice of materials and the use of carefully selected, certified suppliers, from the production of parts up to the final assembly. These details combine to result in reliable fan products with an above-average service life.

ErP Directive
All products with power consumption between 125 W and 500 kW are subject to the European “Energy-related Products Directive” (ErP) for improving energy efficiency, with the first stage applicable from 2013 and the second as of 2015. Thanks to ground-breaking GreenTech EC technology, all of our fans and motors in these performance classes already exceed the ErP Directive today.
Practical applications: fans that are customized and smart

ebm-papst has always developed customer-specific smart fans that meet the exact requirements of the application. We provide a wide range of standard fan types, in many sizes and designs; with smart motor features, monitoring and control functions, as well as special designs for use under extreme conditions. They are all based on the standard type fans that you will find in this catalog. Special fan types for your application can be produced in economical batch sizes. Our expert engineers will assist you in selecting the right configuration.
Innovation at its best: Vario-Pro® with “intelligence inside”. Its programmed intelligence thanks to customer-specifically configured software modules makes the cooling of electronics even more economical and flexible. For example, temperature-dependent speed profiles are possible with a number of freely selectable interpolation points. External speed settings and a variety of combinable alarm and tachometer functions can also be programmed. The digital motor management achieves high control accuracy.

Higher degree of protection for every type of application
ebm-papst provides, on request, many fan series in versions that meet to the requirements of degree of protection IP 54 and IP 68: Their stator and all electrical components are fully encapsulated. Stainless steel ball bearings can be used for operation in particularly aggressive media and use under extreme environmental conditions, thus providing additional reliability.

Almost anything is possible
Regardless of your cooling and ventilation tasks, we will develop the right solution. And the most economical one. Based on the fans listed in this catalog, more than 4000 different versions are available.

Temperature-controlled fans
Fans with temperature-controlled speed have particularly quiet cooling characteristics. Thanks to integrated IC technology, they adapt their speed to the current cooling requirements. The result is a drastic reduction of noise in most operating conditions. A temperature sensor provides the fan with thermal information: either externally via an exposed wire or integrated into the hub of the fan.

Speed setting via interfaces
With a wide range of DC fans with separate control input, ebm-papst provides an alternative to the NTC-controlled types of fans. They are especially suitable for systems and units that already have standard interfaces for varying speed via internal switching and control circuits.

The main applications are units that require load-dependent, individual speed profiles or systems with minimum standby cooling requirements and varied speed increase at varying power peaks.

Electronic tachometer
Do you want to be informed about the current fan speed at all times? ebm-papst has fans with an integrated “electronic tachometer”. It registers the actual value of the fan speed. Via an integrated sensor, the fan generates speed-dependent signals that can be used directly. Depending on the number of poles of the motor, 2, 3, or 6 pulses per revolution are generated.

Alarm signal for greater safety
If your application requires monitored fan operation, in addition to speed monitoring, ebm-papst also provides a multitude of varying alarm signals. Depending on the type of fan in question, the signal will either be static, already evaluated, or interface-compatible. The alarm signal output provides reliable long-term monitoring and a status signal if critical operating conditions arise.

S-Force
When you need to provide extremely fast, powerful and efficient cooling for electronic components of all kinds, the generation of S-Force high-performance fans finishes first: in air performance, pressure increase, and technology. Extremely efficient drives and optimized aerodynamics form the core technology of the S-Force fans, which we offer in both an axial and centrifugal model.

S-Panther
S-Panther power delivered quietly. Wherever there is need for power and reduced noise, fans from the S-Panther range are the right solution. A strong pressure saddle curve at optimum air flow provides the power of a real big cat, an S-Panther.
In the catalog, a text box in the upper right corner provides information on the special designs that are technically possible in the fan series.

Please note that these special versions are not possible for all voltages and speeds, and not in all combinations. The special versions are designed for specific customers and projects and are usually not available off the shelf.

### Speed signal /2, /12
The fan uses a separate wire to output information about its speed, and thus about the speed of the rotor. For technical details, please refer to page 178 and the following.

### Go- / NoGo alarm /37, /39
The fan uses a separate wire to output a static signal when it is stationary, thus providing information about whether or not the rotor is turning. For technical details, please refer to page 182 and the following.

### Alarm with speed limit /17, /19
When one of the speeds defined in the fan electronics is undershot, the fan outputs a static signal providing information that the set speed limit was undershot. For technical details, please refer to page 180 and the following.

### External temperature sensor
An NTC resistor (negative temperature coefficient) is attached to the fan via a separate wire and the fan changes its speed depending on the temperature on the NTC. For technical details, please refer to page 184.

### Internal temperature sensor
In this case, the NTC is integrated into the fan and the fan changes its speed depending on the temperature at the NTC. For technical details, please refer to page 184.

### PWM control input
The speed of the fan can be changed via a pulse-width-modulated signal. This signal is applied to a specially provided wire. For technical details, please refer to page 185.

### Analog control input
The speed of the fan can be changed via a control voltage. This control voltage is applied to a specially provided wire. For technical details, please refer to page 185.

### Multi-option control input
The fan has a control input that the user can trigger either using a PWM signal, an analog signal, or a variable resistor. For technical details, please refer to page 186.

### Moisture protection
Protection for the fan electronics against moisture and condensation. For technical details, please refer to page 188.

### Degree of protection IP 54* / IP 68*
Protection of motor and circuit board against splashed water and moisture. For technical details, please refer to page 188.

### Salt spray protection
Protection of fan against the damaging effects of salt spray. For technical details, please refer to page 188.

### Direction of rotation
On many variants, the direction of rotation can be changed via a control input.

---

**Possible special designs are depicted on the catalog page.**

---

### DC axial fans

---

#### Material:
- Housing: GRP* (RPM)
- Impeller: GRP* (PA)

#### Direction of air flow:
- Exhaust over struts

#### Direction of rotation:
- Clockwise, seen on rotor

#### Connection:
- Single wire 22AWG, TR 64

#### Highlights:
- Developed for applications with demanding environmental requirements
- Mass: 70 g

#### Possible special versions:
- Speed signal
- Go- / NoGo alarm
- Alarm with limit speed
- External temperature sensor
- PWM control input
- Analog control input
- Humidity protection
- Salt spray protection
- Degree of protection: IP 54* / IP 68*

---

* IP = International degree of protection marking

For AC fans max. IP 65 available.
Types of fans and their function

Axial fans:
High air flow with medium to relatively high pressure increase
The air flow in axial fans with an impeller that is similar to a propeller is conducted largely parallel to the axis of rotation, in other words in the axial direction. Axial fans with free air delivery at zero static pressure have the lowest power input that rises with increasing back pressure. Axial fans for cooling of electronic equipment are mostly equipped with external housing. The electric motor is integrated in the fan hub. This compact design allows space-saving accommodation of all devices. The flange is equipped with mounting holes.

Diagonal fans:
High air flow at relatively high pressure increase
At first glance diagonal fans only differ slightly from axial fans. Intake is axial, whereas exhaust is diagonal. Due to the conical shape of the wheel and housing, the air is pressurized more in the diagonal fan. In direct comparison with axial fans of the same size and comparable performance, these fans are distinguished by the lower operating noise at high pressures.

Centrifugal fans:
High pressure increase at limited flow rate
Generally, many cooling tasks can be performed excellently by axial and/or diagonal fans. But if the cooling airflow has to be deflected at an angle of 90°, for example, or if even greater pressure increase is necessary, centrifugal fans are more effective. For your application, ebm-papst offers not only complete centrifugal fans, but also motor/impeller combinations without external housing.

Tangential fans:
High air flow with low pressure increase
Tangential fans are used especially to produce a wide airflow distribution through devices. The air flows through the roller-shaped impellers twice in the radial direction: in the intake area from the outside to the inside and in the outflow area from the inside to the outside. Whirls form in the roller due to the vanes, which guarantee a steady flow of air through the impeller.
1. **Dissipated energy**
A large amount of the energy consumed by electrical and electronic devices is converted to heat. So when selecting the correct fan, it is important to determine the dissipated energy that must be removed. The electrical power consumption of the unit to be cooled often represents a suitable value for this purpose.

2. **Admissible temperature increase**
The air flow that the selected fan is required to generate, is determined by the dissipated energy and the admissible heating ($\Delta T$) of the cooling airflow (from entry to exit of the device to be cooled). The maximum admissible $\Delta T$ depends greatly on the temperature sensitivity of the individual parts of the device. For example, $\Delta T = 5K$ means that the average cooling airflow leaving the device to be cooled may be only $5^\circ C$ warmer than the ambient temperature. This requires a lot of air. A lower air flow rate is sufficient if a higher temperature difference (e.g. $\Delta T = 20K$), can be tolerated.

3. **Required cooling airflow**
- In the diagram below, a horizontal line is drawn from the dissipated energy to intersect with the selected $\Delta T$ line.
- Read down from this point to obtain the required value for the cooling airflow. The diagram is based on the following formula:

$$ q_v = \frac{P_V}{C_{PL} \cdot \rho_L \cdot \Delta T} $$

4. **Optimum operating range**
But the fan you are looking for must also be able to deliver a suitable static pressure increase $\Delta p_f$, in order to force the cooling air through the device. So a fan must be selected that provides the required air flow performance within its optimum operating range (see also the air performance curves under technical data).

5. **Fan selection**
If more than one fan meets your requirements, the sound level, space requirements, economy, and ambient conditions will assist in making the final choice.

---

**Definitions**

- $P_V$ = amount of heat to be dissipated in [W]
- $C_{PL}$ = specific heat capacity of air in [J/kg/K]
- $\Delta T = T_1 - T_2$ = temperature difference in [K] between inlet and outlet
- $\rho_L = 1.2$ kg/m$^3$
Fan installation

**Intake or exhaust side installation**
Under ideal conditions, the operating point is represented as the intersection between the fan and loss curves, regardless of whether the fan is positioned at the air intake or exhaust side of the device. In addition to ensuring the required flow rate, several other aspects must be considered for determining an appropriate fan concept. The intake air currents of a fan are mainly laminar, comprising nearly the entire suction area. By contrast, the exhaust air of a fan is generally turbulent and flows in a preferred direction, such as axial for an axial fan. The turbulence of the exhaust intensifies the heat transfer from components within the air currents, so that installing the fan on the air intake side of the device is recommended for cooling and heating. Installing the fan at the device intake is also advantageous because the fan will not be subjected to the dissipated heat of the device. Therefore, it operates at low ambient temperatures and has a greater life expectancy.

**Information on installation**
When a fan is operated for the first time in an application, the user may have noticed that the air flow in the device was lower than expected. What is the reason for this?
- The values stated in this catalog were determined under optimum, constant, and comparable measurement conditions.
- Ideal installation conditions under which free air intake and exhaust are present are seldom feasible in practice. Quite frequently, the fans have to be installed in close proximity to other components or cabinet panels. As a consequence, the intake and exhaust currents may be restricted, causing the air flow to diminish and the sound level to increase. Fans are particularly sensitive to obstructions that are positioned directly in front of the output cross section, and they often cause an increase in tonal noise.

**Our advice:** The distance between the fan and adjacent components should be at least equal to the installation depth of the fan.

### Accident prevention

The turning rotor and the high speeds that are sometimes involved mean that our fan products carry an inherent risk of injury. They may only be operated after correct installation and with suitable protective equipment (e.g. with a finger guard). More information can be found in the Internet at: [www.ebmpapst.com/safety](http://www.ebmpapst.com/safety)
Service life
Due to the high currents in the fans, the load on the electrolyte capacitors is greater, which reduces the service life of the capacitor. As a larger or additional capacitor cannot be housed in the fan, the capacitor must be housed in the supply line.

If the power supply of the application has a corresponding capacitor, in some cases it may be possible to omit the external capacitor.

Recommended capacitors
We recommend using the following capacitors from Rubycon:

- **24 VDC:**
  - 50 ZL 680 μF; 12.5 mm x 30 mm or
  - 50 ZLH 680 μF 12.5 mm x 30 mm

- **48 VDC:**
  - 100 YXG 470 μF; 16 mm x 35.5 mm or
  - 100 ZLH 470 μF 16 mm x 31.5 mm

Other capacitors with equal or greater capacitance and equal or lower serial resistance can also be used.

**S-Force centrifugal**

- RET 97 TD
- RER 120 TD
- RER 133 TD
- RER 160 NTDHH
- REF 175 TD
- RER 175 TD
- RER 190 TD / RG 190 TD
- RER 220 TD / RG 220 TD
- RER 225 TDM / RG 225 TDM
- RER 225 TD / RG 225 TD

Recommended measure: additional external capacitor (should be installed as close to the fan as possible < 30 cm).
Service life data from ebm-papst St. Georgen

Our fans catalog gives three different values for the service life of each product. The first column usually states the service life \( L_{10} \) at 40 °C, the second column usually states the service life \( L_{10} \) at \( T_{\text{max}} \). Exceptions are marked in the column headings. The third column states the new value, life expectancy \( L_{10\text{IPC}} \) (40 °C).

Service life \( L_{10} \) (40 °C) and \( L_{10} \) (\( T_{\text{max}} \))

The values given in the first two columns have been derived from intensive, in-house service life endurance tests in which our products are operated in various positions at 40 °C and 70 °C until they fail. A fan is deemed to have failed when it deviates from its defined air flow and speed values, or when the operating noise becomes noticeable. Such tests can take several years before a representative number of failures has been registered, and even today, some fans are still in the process of endurance testing, even though the test began early in the 1980s. These fans are proof of the legendary “made by ebm-papst” reliability. Test results are presented in a diagram and the service life of the product \( L_{10} \) at the temperature tested is determined based on the Weibull distribution.

These tests have given us years of experience in the way various design parameters and temperatures can affect the service life of a product. Data for service life at various temperatures for new products can be stated with a very high degree of precision based on tests, product specifications, and commonalities in the design of the product.

Life expectancy \( L_{10\text{IPC}} \) (40 °C)

The new third service life column states the life expectancy \( L_{10\text{IPC}} \). This information is based on the international standard IPC 9591. Again here, the foundations for the service life values are our service life endurance tests at high ambient temperatures. The service life at temperatures below the test temperatures is calculated using fixed factors. This method produces much higher service life values, especially at room temperature (see diagram on right).

Summary:

The life span calculations have been carried out to the best of our knowledge and are based on experience gained by ebm-papst. The specified \( L_{10} \) (40 °C), \( L_{10} \) (\( T_{\text{max}} \)) and \( L_{10\text{IPC}} \) (40 °C) values all allow statements to be made about the theoretical calculated service life under certain assumptions. The values determined here are extrapolations from our own service life tests and from statistical variables. In the respective customer applications, there may be different influencing factors that cannot be included in the calculations due to their complexity. The service life information is explicitly not a guarantee of service life, but strictly a theoretical quality figure.

Example of the influence of factors from various manufacturers on the life expectancy.

Example of the service life figures on the catalog page.
Definitions

Nominal voltage [volts]
The voltage at which the nominal values (the table values listed in this catalog) were determined. The fan operation for DC fans is not limited to the nominal voltage. Fan speed and fan performance can vary according to the admissible voltage range that is specified on the nameplate of each fan. Please note that this is not a pulsed or modulated DC voltage.

Frequency [Hz]
ebm-papst AC fans are made for operating frequencies of 50 Hz or 60 Hz. Their technical data changes accordingly.

Air flow [m³/h, cfm]
The air performance of the fan in free air operation, i.e. the fan blows into the free space without static pressure increase.

Fan curves
The fan curves are determined in accordance with DIN ISO 5801 specifications on a dual-chamber test stand with intake side measurement. This measurement technique closely approximates the operating conditions experienced in typical applications for fans and yields realistic performance curves. The curves apply to an air density of \( \rho = 1.2 \text{ kg/m}^3 \) corresponding to an air pressure of 1013 mbar at 20 °C. Variations in air density affect pressure generation, but not the flow rate. The pressure generated at other air densities can be estimated with the formula \( \Delta \rho = \frac{\Delta \rho_2}{\rho_2 / \rho_1} \).

The nominal speed values, air flow and power consumption listed in the table were measured in free air operation with horizontal shaft at an ambient temperature of 20 °C - 25 °C, air density \( \rho = 1.2 \text{ kg/m}^3 \) after a warmup period of 5 min.

Optimum operating range
The optimum operating range is always indicated in the colored area in the air performance diagrams. In this range the fans operate best with respect to efficiency and sound level. Within this optimum operating range the sound level only fluctuates slightly.

Noise [dB(A), Bel(A)]
1. Sound pressure level – dB(A)
Noise ratings of the fan in free air operation, i.e. at maximum flow rate.

2. Sound power level 1 Bel(A) = 10 dB(A)
Extent of the overall sound radiation of the fan. The sound power level is determined in the optimum operating range.

PAPST Sintec® sleeve bearings
A particularly economical bearing system with excellent advantages:
- Very precise, large sintered bearings
- Low running noise
- High service life expectancy
- Resistant to shock and vibration

Ball bearings
Precision ball bearings for particularly high ambient temperatures and high service life expectancy.

Power consumption [watts]
Input performance of the fan motor when operating free blowing at nominal voltage. Depending on the operating condition in the application, the power consumption may be significantly higher.

Temperature range [°C]
The admissible ambient temperature range within which the fan can be expected to run continuously.

Service life [h]
Service life \( L_{10} \) at 40 °C and \( T_{\text{max}} \)
Standard figures for service life at ebm-papst. These two temperatures are based on intensive, in-house endurance tests and on experience from more than 70 years developing fans.

Life expectancy \( L_{10\text{IPC}} \) (40 °C)
Information calculated in line with the standard IPC 9591. Data based on the internal life expectancy at 70 °C, more optimistically extrapolated to 40 °C.

We expressly state that none of the information or data in this catalog is to be construed as a guarantee or warranty of properties.

### Options (various versions possible)

#### A
Analog speed control input (input voltage: 0...5 / 0...10 V DC)

#### D
Reinforced flange corners with through-holes (series 44xx F)

#### E
Constant speed control regardless of operating voltage

#### F
Flat construction / frequency-modulated speed control input

#### G
Sleeve bearing

#### H
High speed

#### HH
Further increased speed

#### H3-H8
Additional further increased speeds

#### I
Integrated temperature sensor (NTC behavior, i.e. thermistor)

#### J
Jet characteristic / rigid curve

#### L
Low speed

#### M
Medium speed

#### ML
Between low and medium speed

#### N
Standard or basic speed

#### O
Multi-option speed control input

#### P
PWM speed control input (pulse-width modulated signal)

#### R
Moisture protection coating

#### S
Speed signal (additional wires for hall signal, obsolete technology)

#### T
External temperature sensor (NTC behavior, i.e. thermistor)

#### TD
Turbo drive (extremely powerful 3-phase motor)

#### U
Environmentally friendly fan (min. IP 54)

#### V / VP
VARIOFAN

#### W
Additional wires (standard length 310 mm)

#### X
Mounting bore hole 3.7 mm

---

All measurements are given in mm.

DC axial fans

DC axial fan overview
DC axial fan / DC diagonal fan
**Product line**
ebm-papst offers you the widest full product line of DC axial and diagonal fans from 25 mm to 280 mm in size. Every single type of fan can be optimally integrated in the respective device concept. The highly economical brushless motor technology of these fans provides a unique variety of intelligent innovations at prices that would have been unthinkable a few years ago.

**Electronic protection against reverse polarity**
ebm-papst DC fans have electronically commutated drives with electronic protection against reverse polarity. The electronics are integrated in the fan’s impeller hub to save space.

**Product life expectancy**
A distinctive feature of DC fan technology is the amazing product life expectancy. The outstanding efficiency of the brushless drive results in lower heat stress for the bearings, which significantly increases the service life of the fan.

**Degree of protection**
DC fans with sleeve and ball bearings are powered by class E insulated motors. All ebm-papst fans conform to the requirements of degree of protection IP 20. Fans conforming to IP 54 / IP 68 and special degrees of protection are also available.

**Voltage range**
Many of our DC fans can be operated on voltages that are up to 50 % lower and 25 % higher than their nominal voltage (see voltage range in the technical tables). This allows the air performance to be adapted to the cooling requirements and the noise to be reduced, even if the fan does not have a control input.

**Closed-loop speed control and monitoring**
Closed-loop speed control and function monitoring are becoming increasingly important in many applications. ebm-papst offers many fans in the standard design with a control input and open-collector speed signal.

**S-Force**
The S-Force fans with their extremely high blower capacity of up to 1100 m³/h and pressure increase of up to 1400 pascals are capable of dealing with the extreme heat load. If needed, these fans can produce up to 100 % more output under full load, and they work with a much broader delivery bandwidth than current models. This makes them ideal for equipment and systems with a high density of components. Thanks to intelligent motor features, they can be adapted individually for any application. S-Force fans are available in standard dimensions. The air flow rate is amazing!

**S-Panther**
S-Panther power delivered quietly. Wherever there is need for power and reduced noise, fans from the S-Panther range are the right solution. A strong pressure saddle curve at optimum air flow provides the power of a real big cat, an S-Panther.

DC axial fans

Max. 4.6 m³/h

- Material: Housing: GRP\(^1\) (PBT)
- Impeller: GRP\(^1\) (PA)
- Direction of air flow: Exhaust over struts
- Direction of rotation: Counterclockwise, looking towards rotor
- Connection: Via single wires AWG 28, TR 64
- Weight: 5 g

Possible special versions:
(See chapter DC fans - specials)
- Speed signal
- Moisture protection

1) Fiberglass-reinforced plastic

Series 250
VWC0025AUBAS

Subject to change

Air performance measured as per: ISO 5801.
Installation category A, without accidental contact.
Noise: Total sound power level L\(\text{W}\)A ISO 10302 measured on a hemisphere with a radius of 2 m.
Sound pressure level L\(\text{p}\)A measured at 1 m distance from fan axis.
The values given are applicable only under the specified measuring conditions and may differ depending on the installation conditions.
In the event of deviation from the standard configuration, the parameters must be checked after installation!
For detailed information see:
http://www.ebmpapst.com/general conditions

From p. 254

Finger guards from p. 254
Air performance measured according to ISO 5801. Installation category A, without contact protection.

- **Material:** Housing: GRP\(^{(1)}\) (PBT)  
  Impeller: GRP\(^{(1)}\) (PA)
- **Direction of air flow:** Exhaust over struts
- **Direction of rotation:** Counterclockwise, looking towards rotor
- **Connection:** Via single wires AWG 28, TR 64
- **Highlights:** Some models are suitable for use at high ambient temperatures
- **Weight:** 17 g

### Possible special versions:
(See chapter DC fans - specials)
- Speed signal
- Go / NoGo alarm
- Moisture protection

### DC axial fans

**Series 400 F VWCO040FU00AS**

Subject to change

Air performance measured according to: ISO 5801.
Installation category A, without contact protection.
Noise: Total sound power level L<sub>WA</sub> ISO 10302 measured on a hemisphere with a radius of 2 m.
Sound pressure level L<sub>pA</sub> measured at 1 m distance from fan axis.
The values given are applicable only under the specified measuring conditions and may differ depending on the installation conditions.
In the event of deviation from the standard configuration, the parameters must be checked after installation!
For detailed information see: http://www.ebmpapst.com/general conditions

1) Fiberglass-reinforced plastic.
Air performance measured according to: ISO 5801.
Installation category A, without contact protection.

Noise: Total sound power level $L_{W}$ measured on a hemisphere with a radius of 2 m.
Sound pressure level $L_{p}$ measured at 1 m distance from fan axis.

The values given are applicable only under the specified measuring conditions and may differ depending on the installation conditions.

In the event of deviation from the standard configuration, the parameters must be checked after installation!
For detailed information see http://www.ebmpapst.com/general conditions

Possible special versions:
- Speed signal
- Go / NoGo alarm
- Moisture protection

*Version with 3-pin Molex plug housing 22-01-2035
Molex Contacts 08-50-0113

Material:
- Housing: GRP (PBT)
- Impeller: GRP (PA)

Direction of air flow: Exhaust over struts
Direction of rotation: Counterclockwise, looking towards rotor
Connection: Via single wires AWG 24 to AWG 28, TR 64
Weight: 33 g

Material:
- Housing: GRP (PBT)
- Impeller: GRP (PA)

Direction of air flow: Exhaust over struts
Direction of rotation: Counterclockwise, looking towards rotor
Connection: Via single wires AWG 24 to AWG 28, TR 64
Weight: 33 g

Subject to change

* Power consumption at free air flow. These values can be significantly higher in the operating point.

8200 JH3 and JH4 also available as standard with PWM control input and speed signal. Speed control range from 2000 rpm up to maximum nominal speed. Standstill at 0% PWM, maximum speed if control cable is interrupted.

Air performance measured according to ISO 5801. Installation category A, without contact protection. Noise: Total sound power level measured on a hemisphere with a radius of 2 m. Sound pressure level measured at 1 m distance from fan axis. The values given are applicable only under the specified measuring conditions and may differ depending on the installation conditions.

In the event of deviation from the standard configuration, the parameters must be checked after installation!

For detailed information see [http://www.ebmpapst.com/general_conditions](http://www.ebmpapst.com/general_conditions)

---

### Additional Notes

- **Material:** Housing: GRP (PBT)
  - Impeller: GRP (PA)
- **Direction of air flow:** Exhaust over struts
- **Direction of rotation:** Counterclockwise, looking towards rotor
- **Connection:** Via single wires AWG 24 (H3 and H4: AWG 22), TR 64
  - 160 g (H3 and H4: 200 g)

Possible special versions:

- Speed signal
- Go / NoGo alarm
- Alarm with speed limit
- External temperature sensor
- Internal temperature sensor
- PWM control input
- Analog control input
- Moisture protection
- Degree of protection: IP 54 / IP 68
DC axial fan unit

- **Material:** Housing: GRP\(^1\) (PBT)  
  Impeller: GRP\(^1\) (PA)

- **Direction of air flow:** Exhaust over struts

- **Direction of rotation:** Counterclockwise, looking towards rotor

- **Connection:** Via single wires AWG 22, TR 64

- **Weight:** 430 g

Subject to change

3200 JH3 and JH4 also available as standard with PWM control input and speed signal.
Speed control range from 2000 rpm\(^{-1}\) up to maximum nominal speed. Standstill at 0% PWM, maximum speed if control cable is interrupted.
* Power consumption at free air flow. These values can be significantly higher in the operating point.

* Power consumption at free air flow. These values can be significantly higher in the operating point.

---

**Air performance measured according to ISO 5801.**

Installation category A, without contact protection.

Noise: Total sound pressure level L_p,A ISO 10360-2 measured on a hemisphere with a radius of 2 m.

Sound pressure level L_p,A measured at 1 m distance from fan axis.

The values given are applicable only under the specified measuring conditions and may differ depending on the installation conditions.

In the event of deviation from the standard configuration, the parameters must be checked after installation!

For detailed information see:
http://www.ebmpapst.com/general conditions

Air performance measured according to ISO 5801, Installation category A, without contact protection.
Noise: Total sound power level L\(_{WA}\) measured at 1 m distance from fan axis.
Sound pressure level L\(_{pA}\) measured on a hemisphere with a radius of 2 m.

The values given are applicable only under the specified measuring conditions and may differ depending on the installation conditions.

The values given are applicable only under the specified measuring conditions and may differ depending on the installation conditions.

For detailed information see http://www.ebmpapst.com/general conditions.

Subject to change

| * Power consumption at free air flow. These values can be significantly higher in the operating point. |

**Possible special versions:**

(See chapter DC fans - specials)

- Speed signal
- Go / NoGo alarm
- Alarm with speed limit
- External temperature sensor
- Internal temperature sensor
- PWM control input
- Analog control input
- Moisture protection
- Salt spray protection
- Degree of protection: IP 54 / IP 68

**Material:** Housing: Die-cast aluminum

**Impeller:** GRP² (PA)

**Direction of air flow:** Intake over struts

**Direction of rotation:** Clockwise, looking towards rotor

**Connection:** Via single wires

**AWG 22 UL 1007, TR 64**

**Highlights:** Housing with grounding lug for screw M4 x 8 (Torx)

**Weight:** 390 g

* Power consumption – in operation

Air performance measured according to ISO 5801.

Installation category A, without contact protection.

Noise: Total sound power level Lₚ (PA) measured on a hemisphere with a radius of 2 m.

Power consumption measured at 1 m distance from fan axis.

The values given are applicable only under the specified measuring conditions and may differ depending on the installation conditions.

In the event of deviation from the standard configuration, the parameters must be checked after installation!

For detailed information see http://www.ebmpapst.com/general conditions
Max. 540 m³/h

DC axial fans

- **Material:** Housing: Die-cast aluminum
  Impeller: GRP (PA)
- **Direction of air flow:** Intake over struts
- **Direction of rotation:** Clockwise, looking towards rotor
- **Connection:** Via single wires AWG 18, 20 or AWG 22, TR 64, speed signal and control input AWG 22
- **Highlights:** Highly efficient and smoothly operating 3-phase fan drive Housing with grounding lug for screw M4 x 8 (Torx)
- **Weight:** 425 g

### Possible special versions:
(See chapter DC fans - specials)
- Speed signal
- Go / NoGo alarm
- Alarm with speed limit
- External temperature sensor
- Internal temperature sensor
- PWM control input (standard)
- Analog control input
- Moisture protection

Subject to change

Speed control range from 500 rpm⁻¹ up to maximum nominal speed.
Standstill at 0 % PWM, maximum speed if control cable is interrupted.
To attain the specified service life, an external capacitor must be wired between the plus and minus strands. Please note the wiring suggestion on page 14.

* Power consumption at free air flow, these values can be significantly higher in the operating point.

### Air performance measured according to ISO 5801.
Installation category A, without contact protection.

Air performance measured on a hemisphere with a radius of 2 m.
Sound pressure level LpA measured at 1 m distance from fan axis.

The values given are applicable only under the specified measuring conditions and may differ depending on the installation conditions.

In the event of deviation from the standard configuration, the parameters must be checked after installation.
For detailed information see http://www.ebmpapst.com/general conditions

Subject to change

* Power consumption at free air flow. These values can be significantly higher in the operating point.
Air performance measured according to ISO 5801.
Installation category A, without contact protection.
Noise: Total sound power level \( L_{WA} \) ISO 10302 measured on a hemisphere with a radius of 2 m.
Sound pressure level \( L_{PA} \) measured at 1 m distance from fan axis.
The values given are applicable only under the specified measuring conditions and may differ depending on the installation conditions.
In the event of deviation from the standard configuration, the parameters must be checked after installation!

Possible special versions:
(See chapter DC fans - specials)
- Speed signal
- Go / NoGo alarm
- Analog control input
- Moisture protection
- Salt spray protection
- Degree of protection: IP 54

Subject to change

Models DV 6424 TD... and DV 6448 TD... are available in customer-specific, custom-developed variants only.
The figures indicated are technically feasible benchmark values. The fans can be specially adapted to your application with signal outputs and control inputs.

For details of the technical possibilities, refer to the chapters on the sensor signal, alarm signal and control inputs beginning on page 175.

* Power consumption at free air flow. These values can be significantly higher in the operating point.

---

1) Fiberglass-reinforced plastic

---

Air performance measured according to ISO 5801.
Installation category A, without contact protection.
Noise: Total sound power level Lₘ₉ₐISO 10302 measured on a hemisphere with a radius of 2 m.
Sound pressure level Lₚₐ measured at 1 m distance from fan axis.
The values given are applicable only under the specified measuring conditions and may differ depending on the installation conditions.
In the event of deviation from the standard configuration, the parameters must be checked after installation!
For detailed information see:
http://www.ebmpapst.com/general conditions

**Possible special versions:**
- Speed signal
- Go / NoGo alarm
- Alarm with speed limit
- External temperature sensor
- Internal temperature sensor
- PWM control input (standard)
- Analog control input
- Multi-option control input
- Moisture protection
- Salt spray protection
- Degree of protection: IP 54

**Nominal data**

- **Air flow**: 1030 m³/h
- **Nominal voltage**:
  - Type: 48 VDC
- **Sound pressure level**: 76 dB(A)
- **Power consumption**: 160 Watts

**Material**: Housing: Die-cast aluminum
Impeller: GRP\(^1\) (PA)

**Direction of air flow**: Exhaust over struts

**Direction of rotation**: Counterclockwise, looking towards rotor

**Connection**: Via single wires AWG 18, 20 or AWG 22, TR 64, speed and alarm signals: AWG 22

**Highlights**:
- Highly efficient and smoothly operating 3-phase fan drive
- Housing with grounding lug for screw M4 x 8 (Torx)
- **Weight**: 875 g

\(1\) Fiberglass-reinforced plastic

Speed control range from 1000 rpm⁻¹ up to maximum nominal speed. Standstill at 0 % PWM, maximum speed if control cable is interrupted.

* Power consumption at free air flow. These values can be significantly higher in the operating point.

---

Air performance measured according to ISO 5801. Installation category A, without contact protection.

Noise: Total sound power level \(L_W\) measured on a hemisphere with a radius of 2 m.

Sound pressure level \(L_p\) measured at 1 m distance from fan axis.

The values given are applicable only under the specified measuring conditions and may differ depending on the installation conditions.

In the event of deviation from the standard configuration, the parameters must be checked after installation!

### Special versions

- Speed signal
- Go / NoGo alarm
- Alarm with speed limit
- External temperature sensor
- Internal temperature sensor
- PWM control input (standard)
- Analog control input
- Multi-option control input
- Moisture protection
- Salt spray protection
- Degree of protection: IP 54

### Material

- Housing: Die-cast aluminum
- Impeller: GRP (PA)

### Connection

- Via single wires AWG 18, 20 or AWG 22, TR 64, speed signal and control input AWG 22

### Highlights

- Highly efficient and smoothly operating 3-phase fan drive

### Weight

- 910 g

### Series 6300 TD

VWS0148XULDS

### Fan type

- 6318/2 TDHHP
- 6318/2 TDH4P

### Power consumption

*Power consumption – in operation*

Air performance measured according to ISO 5801.
Installation category A, without contact protection.
Noise: Total sound power level Lw(A) ISO 10322 measured on a hemisphere with a radius of 2 m.
Sound pressure level Lp(A) measured at 1 m distance from fan axis.

The values given are applicable only under the specified measuring conditions and may differ depending on the installation conditions.

In the event of deviation from the standard configuration, the parameters must be checked after installation!

Curves:

Air performance measured according to ISO 5801, installation category A, in ebm-papst full nozzle without contact protection. Suction-side noise levels: LWA according to ISO 13347, LA measured at 1 m distance from fan axis. The values given are applicable only under the specified measuring conditions and may differ depending on the installation conditions. In the event of deviation from the standard configuration, the parameters must be checked after installation. For detailed information see [http://www.ebmpapst.com/general conditions](http://www.ebmpapst.com/general conditions).
- **Technical features:** See connection diagram p. 277
- **EMC:** Interference emission acc. to EN 55022 (Class B)
  Immunity to interference acc. to EN 61000-6-2 (industrial environment)
- **Cable exit:** Lateral
- **Conformity with standard(s):** EN 60950-1, UL 1004-1, CSA C22.2 no. 100
- **Approvals:** GOST, UL
DC centrifugal fans

DC centrifugal fans overview
DC centrifugal fans
DC tangential fans
DC centrifugal fans and blowers
Product line
Our centrifugal product line includes fans for every application. Whether as free-running impellers with a diameter between 97 mm and 225 mm, or as assemblies in a ready-to-install, compact housing with inlet ring with an edge length between 51 mm and 270 mm. Of course, all models feature highly efficient, brushless motor technology.

Electronic protection against reverse polarity
ebm-papst DC fans have electronically commutated drives with electronic protection against reverse polarity. The electronics are integrated in the fan's impeller hub to save space.

Product life expectancy
A distinctive feature of DC fan technology is the amazing product life expectancy. The outstanding efficiency of the brushless drive results in lower heat stress for the bearings, which significantly increases the service life of the fan.

Degree of protection
DC fans with sleeve and ball bearings are powered by class E insulated motors. All ebm-papst fans conform to the requirements of degree of protection IP 20. Fans conforming to IP 54 / IP 68 and special degrees of protection are also available.

Voltage range
Many of our DC fans can be operated on voltages that are up to 50% lower and 25% higher than their nominal voltage (see voltage range in the technical tables). This allows the air performance to be adapted to the cooling requirements and the noise to be reduced, even if the fan does not have a control input.

Closed-loop speed control and monitoring
Closed-loop speed control and function monitoring are becoming increasingly important in many applications. ebm-papst offers many fans in the standard design with a control input and open-collector speed signal.

S-Force centrifugal RadiCal
The S-Force centrifugal fans provide peak performance among fans of this type. With air flow capacity of over 1500 m³/h and a pressure increase of up to 1000 pascals, the highest heat flows are manageable. The models are extremely efficient due to the multi-pole, electronically commutated drive motors, and can be adapted individually to every application thanks to intelligent motor features. Some models use our highly efficient RadiCal impellers.

Please note that these special versions are not possible for all voltages and speeds, and not in all combinations. The special versions are designed for specific customers and projects and are usually not available off the shelf.

Optional special versions (see page 10)

On the catalog pages and in the overview on page 10, we provide information about the special designs that are technically feasible in the fan series. Please note that these special versions are not possible for all voltages and speeds, and not in all combinations. The special versions are designed for specific customers and projects and are usually not available off the shelf.
Air performance measured according to: ISO 5801.
Installation category A, without contact protection.
Noise: Total sound power level $L_{WA}$ ISO 10302 measured on a hemisphere with a radius of 2 m.
Sound pressure level $L_{PA}$ measured at 1 m distance from fan axis.
The values given are applicable only under the specified measuring conditions and may differ depending on the installation conditions.
In the event of deviation from the standard configuration, the parameters must be checked after installation!
For detailed information see http://www.ebmpapst.com/general conditions

Possible special versions:
(See chapter DC fans - specials)
- Speed signal
- PWM control input
- Moisture protection

Max. 9.6 m³/h

DC centrifugal fans
51 x 15 mm

- Material: Scroll housing: GRP
- Impeller: GRP
- Direction of air flow: Axial: Intake, Centrifugal: Exhaust
- Connection: via single wires AWG 26, TR 64
- Highlights: Forward-curved impeller
- Weight: 40 g

1) fiberglass-reinforced plastic.

Air performance measured according to:
ISO 5801.
Installation category A, without contact protection.

Notes:
Total sound power level LWA ISO 10352
measured on a hemisphere with a radius of 2 m;
Sound pressure level LpA measured at 1 m
distance from fan axis.
The acoustic values are only valid for
the described measurement setup and may vary
depending on the installation situation.
In the event of deviation from the standard
configuration, the parameters must be checked
after installation!
For detailed information see:
http://www.ebmpapst.com/general conditions

Screw clip M4 or 8-32UNC. Screw-in depth max. 12.5 min. 9.0

*Federmutter M4 oder 8-32UNC. Einschraubtiefe max. 12,5 min. 9,0
Tin-plated
Air performance measured according to: ISO 5801.
Installation category A, without contact protection.
Noise: Total sound power level $L_{W_{A}}$ ISO 10302 measured on a hemisphere with a radius of 2 m.
Sound pressure level $L_{p_{A}}$ measured at 1 m distance from fan axis.
The values given are applicable only under the specified measuring conditions and may differ depending on the installation conditions.
In the event of deviation from the standard configuration, the parameters must be checked after installation!

Models RG 160-28/14 NTD... and RG 160-28/18 NTD... are available in customer-specific, custom-developed variants only.
The figures indicated are technically feasible benchmark values.
The fans can be specially adapted to your application with signal outputs and control inputs.
*The specific service life is valid when an external capacitor is wired between the positive and negative wires.

Please note the wiring suggestion.

Models RG 160-28/14 NTD... and RG 160-28/18 NTD... are available in customer-specific, custom-developed variants only.
The figures indicated are technically feasible benchmark values.
The fans can be specially adapted to your application with signal outputs and control inputs.
*The specific service life is valid when an external capacitor is wired between the positive and negative wires.

Please note the wiring suggestion.
DC centrifugal fans – RadiCal

- Material: Scroll housing: GRP<sup>1)</sup>
  Impeller: GRP<sup>1)</sup>
- Direction of air flow: Axial: Intake, Centrifugal: Exhaust
- Direction of rotation: Clockwise, looking towards rotor
- Connection: via single wires AWG 18, 20 or AWG 22, TR 64. Speed signal and control input AWG 22
- Highlights: Highly efficient and smoothly operating 3-phase fan drive
  Backward-curved RadiCal impeller
- Weight: 1210 g

The air flow and sound level of the centrifugal fans without external housing depend on their individual installation conditions.

The stated air flow and sound level were recorded under the following measurement parameters:
Centrifugal fan mounted on a foundation plate 127 x 127 mm.
Cover plate 127 x 127 mm, with an air inlet opening Ø 70 mm, arranged concentrically to the impeller.

The air flow and sound level of the centrifugal fans without external housing depend on their individual installation conditions.

The stated air flow and sound level were recorded under the following measurement parameters:
Centrifugal fan mounted on a foundation plate 220 x 220 mm.
Cover plate 220 x 220 mm, with an air inlet opening Ø 86 mm, arranged concentrically to the impeller.

Air performance measured according to ISO 5801.
Installation category A, with ebm-papst inlet ring without contact protection.
Noise: Total sound power level Lₚw ISO 10302 measured on a hemisphere with a distance of 2 m.
Sound pressure level LₚpA measured at 1 m distance from fan axis.
The values given are applicable only under the specified measuring conditions and may differ depending on the installation conditions.
In the event of deviation from the standard configuration, the parameters must be checked after installation!
For detailed information see http://www.ebmpapst.com/general conditions
### DC centrifugal fans

**Ø 133 x 91 mm**

- **Material:** Impeller: GRP<sup>1</sup>
- **Direction of air flow:** Axial: Intake, Centrifugal: Exhaust
- **Direction of rotation:** Clockwise, looking towards rotor
- **Connection:** via single wires AWG 18, 20 or AWG 22, TR 64. Speed signal and control input AWG 22
- **Highlights:** Highly efficient and smoothly operating 3-phase fan drive
  Backward-curved impeller
- **Weight:** 890 g 
  460 g RadiCal

**Possible special versions:**
(See chapter DC fans - specials)
- Speed signal
- Go / NoGo alarm
- Alarm with speed limit
- External temperature sensor
- Internal temperature sensor
- PWM control input
- Analog control input
- Multi-option control input
- Moisture protection

Speed control range from 800 rpm⁻¹ at 7 % PWM up to nominal speed at > 90 % PWM.
Standstill at 0 % PWM, Standstill if control cable is interrupted.

The air flow and sound level of the centrifugal fans without external housing depend on their individual installation conditions.
The stated air flow and sound level were recorded under the following measurement parameters:
Centrifugal fan mounted on a foundation plate 225 x 225 mm.
Cover plate 225 x 225 mm, with an air inlet opening Ø 125.5 mm, arranged concentrically to the impeller.

Inlet rings from p. 268
EC centrifugal fans – RadiCal
Ø 190 mm

- Material: Impeller: PA plastic
  Rotor: Galvanized
- Number of blades: 7
- Direction of rotation: Clockwise, looking towards rotor
- Degree of protection: Motor IP24 KM, electronics IP6K9K (mating connector installed)
- Insulation class: “B”
- Installation position: Shaft horizontal or rotor on bottom; rotor on top on request
- Condensation drainage holes: On rotor side
- Mode of operation: Continuous operation (S1)
- Bearings: Ball bearing; (sealed)

Cooling capacity and efficiency

Greater power density, increasing miniaturization and extreme electronic component density are placing increased demands on the cooling capacity and efficiency of fans. Therefore, intelligent and space-saving integration of the fan in the device configuration is very important:

- Tailor-made cooling adapted to the situation as and when required.
- Programmable cooling by defining speed profiles.
- Transparency of function thanks to complete, interactive monitoring in all operating conditions.

Standard fans in electronics cooling have proven themselves a million times over.

With a constant speed and an appropriate sound level, they continuously provide the air flow required for extreme cases. But these extreme situations occur seldom – if at all – during operation. What is needed is an intelligent fan that adapts automatically to the level of cooling required at the time.

ebm-papst provides intelligent cooling concepts that are optimally adapted to practical requirements. For example:

1. Speed adjustment via temperature sensor

   ebm-papst answers with a complete range of DC fans with temperature-controlled speed adjustment via a temperature sensor, available in a variety of standard dimensions.

   Installation is very simple. Either an external temperature sensor in the form of an exposed wire that can be placed anywhere, or an internal sensor located directly in the fan hub in the air flow provides continuous and undissipated thermal information to the control electronics for speed adjustment. A range of temperature sensors can be found on page 184.

2. DC fans with separate control input

   Open or closed-loop speed control is also possible with DC fans that have a separate control input. So a control voltage or a pulse-width modulated signal can be used to vary the speed. These options are used primarily in devices that have the appropriate standard interfaces and require varied fans depending on the load.
3. Speed signal
DC fans with speed signal.
The integrated “electronic tachometer” continuously provides an actual speed signal for external evaluation. A very simple signal evaluation on the customer side informs the user of the current fan speed at all times. The speed signal is provided by a separate wire.

4. Alarm signal
For applications that require monitored fan operation with an alarm signal, ebm-papst offers a number of alarm signals variants. Depending on the type of fan in question, the signal will either be static, already evaluated, or a continuous, interface-compatible, high or low signal. The alarm signal is provided by a separate wire.

5. Turbo drives
Fans with three-phase EC drives and microprocessor-controlled motor electronics. The torque of these three-phase motors, which is virtually independent of the rotor position, allows the fan to run very smoothly. The speed of these fans can be controlled over a very wide speed range by means of PWM, analog voltage, or temperature. Optionally, the fans can be supplied with reversible direction of rotation and active brake operation.

6. Protection against environmental conditions
Some applications place particular demands on the fans’ resistance to environmental conditions, such as dust, moisture, water, and salt. ebm-papst offers solutions for adapting fans to these conditions.
Available on request:

- Electrically isolated speed signal circuit
- Varying voltage potentials for power and logic circuit

### Speed signal /2

- Speed-proportional, square-wave signal for external monitoring of the fan motor speed
- 2, 3, or 6 pulses per revolution
- Open-collector signal output
- Extremely wide operating voltage range
- Easy adaptation to user interface
- Connection via separate cable
- The sensor signal also serves as a major comparison variable for setting and maintaining the setpoint speed for interactive or controlled cooling with one or more interconnected fans.

#### Electrical hookup

All voltages measured to ground.

External load resistor \( R_a \) / \( U_S \) / \( U_{BS} \) required.

The sensor signal also serves as a major comparison variable for setting and maintaining the setpoint speed for interactive or controlled cooling with one or more interconnected fans.

### Speed signal /12

- Speed-proportional, square-wave signal for external monitoring of the fan motor speed
- 2, 3, or 6 pulses per revolution
- TTL-compatible
- Integrated pull-up resistor
- Connection via separate cable
- The sensor signal also serves as a major comparison variable for setting and maintaining the setpoint speed for interactive or controlled cooling with one or more interconnected fans.

#### Electrical hookup

All voltages measured to ground.

Available on request:

- Electrically isolated speed signal circuit
- Varying voltage potentials for power and logic circuit

**Subject to change**

Standard value, can vary depending on fan series.

* Depending on the fan electronics other values are feasible e.g. 3 or 6.
Note:
Fans that come with these fan specials could have variations with respect to the temperature range, voltage range, and power consumption compared to standard fans without specials.
Alarm signal /17

Speed limit

- Alarm signal for speed monitoring
- Signal output via open collector
- The fan emits a continuous high signal during trouble-free operation within the permissible voltage range.
- Low signal when speed limit is not reached
- After elimination of the fault, the fan returns to its setpoint speed; the alarm signal reverts to high.

Available on request:
- Integrated signal storage for subsequent recognition of short-term faults (latch).
- Alarm circuit open collector or TTL.
- Electrically isolated for maximum device safety; Defects in the power circuit do not affect the alarm circuit.

Electrical hookup

Subject to change

Standard value, can vary depending on fan series.

For existing products, information about alarm signals is included in the product data sheet.
Speed setting via temperature sensor

The control variable is a temperature sensor that is either integrated in the fan or connected to an additional control cable.

External temperature sensor type T

- Ext. NTC resistor type LZ370 (p. 272) is required (not included in the standard scope of delivery)

Internal temperature sensor type I

- NTC integrated in the fan hub

Standard speed/temperature curve for type T and type I

Optionally available with selectable temperature/speed curve

\[
\begin{align*}
T_{\text{min}} & \approx 30 \, ^\circ\text{C}, \quad T_{\text{max}} = 50 \, ^\circ\text{C} \\
n_{\text{min}} & = \frac{1}{2} n_{\text{max}} \\
n_{\text{min}} = 800 \, \text{rpm} \\
n_{\text{max}} & \text{ based on model} \\
T_{\text{min}} & = 5 \, ^\circ\text{C} \\
T_{\text{max}} & \leq 85 \, ^\circ\text{C}, \text{ based on model}
\end{align*}
\]
Speed setting via control voltage or PWM signal

- The control variable is a PWM signal or analog control voltage.

**Speed setting via analog control voltage type A**

- Standard control range 0...10 V

**Speed setting via PWM type P**

- Standard PWM signal in two versions
  a) PWM frequency, mainly 1...10 kHz (0-100%), Open-collector input
  b) Four-wire interface according to Intel specifications for 12 VDC fans, PWM frequency 25 kHz, incl. speed signal /2

**Typical input resistance > 10 k**

**Standard P / A curve**

Speed setting via multi-option control input

- Customer can operate input either with PWM signal, analog voltage, external temperature control module, or resistor.
- The control signal speed characteristics of the fan differ from the standard curve of the A and P inputs (see p. 185).
- To reach the maximum speed, the control cable must be connected to the U.".
- The control input is usually combined with an open collector tachometer (type /2, see page 178).

### Speed setting via multi-option control input type O

FanCheck is a diagnostic tool integrated into the fan electronics for determining the remaining service life of the fan, dependant, upon temperature, speed, and preset environmental parameters. The FanCheck system emits a pulse width modulated signal, which reflects the remaining service life of the fan. The pulse width is proportional to the remaining service life of the fan. The FanCheck signal has a pulse width of 10 % at the end of the service life and a pulse width of 90 % with full service life. Basic data, such as the ball bearing system, bearing lubrication or lubricant used, are programmed in advance as parameters into the software. The customer defines the environmental conditions, such as the use of fans in moist, dusty, or dirty environments; other parameters such as ambient temperature and speed are determined continuously. Based on all the influencing parameters, the software can, by means of a complex algorithm, calculate the remaining service life for each individual fan. To be able to better demonstrate function, the FanCheck system possesses a demo function for samples, in which the service life expires much more quickly than in real time. Using the alarm signal, tacho signal or an additional lead, the remaining service life can be retrieved and analyzed. Depending on the selected feature, the remaining service life can be emitted in the form of a PWM or an analog signal. In this way, optimum benefit is gained from the individual service life of each fan; thus, a fan exchange that is too early or too late can be avoided.
Protected fans
against environmental conditions

- Capable of satisfying special requirements for a broad range of applications
- Resistance of fans to environmental conditions such as dust, splashing water, humidity, spray water, and salt spray.
- Competent solutions to adapt fans to environmental conditions.

Moisture protection
A coat of paint over the motor and circuit board protect the fans against spray water and condensation.

Degree of protection IP 54 / IP 68*
In the degree of protection IP 54, the motor and circuit boards are coated and therefore protected against spray water and moisture.

The degree of protection IP 68 is important for ebm-papst products, as it ensures a high degree of protection for the encapsulated motor and electronics against foreign bodies and water, while protecting the user against potential hazards upon contact. Degrees of protection higher than IP 68 are possible on request.

Solutions that are available and are used may differ depending on the fan size. We would be glad to develop solutions tailored to the demands of your application.

Salt spray protection
Salt spray represents one of the most difficult requirements for product durability. ebm-papst has the technology to protect fans and blowers from salt spray reliably and for the long term.

Stainless steel bearings
Special bearings made of stainless steel provide additional protection.

ACmaxx / EC axial fans

Technical information about ACmaxx
Overview
ACmaxx axial fans
GreenTech EC tubeaxial fans
Energy-saving axial fans
EC axial fans
ACmaxx in-line duct fans
Progress made by ebm-papst
The best example: The ACmaxx fans from ebm-papst that offer substantial benefits thanks to an ingenious yet simple improvement over conventional AC fans.
The aim in developing the ACmaxx series was to raise the technical standard of the conventional AC fan significantly and in the process facilitate a transition to new technology by maintaining the same fan sizes. In short, to make sure that the fans can be replaced 1:1 without any changes to the peripherals or voltage situation.
ebm-papst offers two generations of ACmaxx products that meet different needs.

What the ACmaxx and GreenTech EC compact fans have in common: Energy efficiency
A drive concept based on state-of-the-art GreenTech EC technology with outstanding motor efficiency. Compared to AC fans of the same size, ACmaxx energy consumption is up to 77 % lower – for greater cooling capacity! The energy savings alone means that the products pay for themselves after only a few months. The savings over the entire service life, especially in systems with multiple fans, is considerable.

Independent of the power frequency and line voltage
The ACmaxx and GreenTech EC tubeaxial fans are prepared for direct connection to a wide range of AC voltages and frequencies. The speed, and thus important properties of the fan such as air flow and noise, are independent of the power frequency and do not change, even within the defined voltage range. Voltage fluctuations in the power system are automatically compensated for.

Long service life
The efficiency of ACmaxx and GreenTech EC tubeaxial fan motors is up to 75 % greater than that of conventional AC fan variants. This not only saves energy, it also means less self-heating of the motor. Especially the bearing system responds positively to the low self-heating. The reason why the fans have a service life that is up to 85 % longer! This also extends the service and maintenance intervals significantly. Investments in replacement fans and every more expensive downtime are manageably small.

Technical information about ACmaxx / GreenTech EC tubeaxial fans
Safety

- Safety certifications: UL, CSA and VDE 0805 / EN60950. VDE 0700 / EN60335 on request.
- Our fans have the CE mark of conformity.
- EMC protection:
  - EN61000-4-4 Level 1 (1 kV or 2 kV) B
  - EN61000-4-2 Level 8 kV/15 kV or 4 kV/8 kV
  - EN61000-4-3
  - EN61000-4-6
  - EN61000-4-8
  - EN55022 Class B

The environment

AC fans are extremely common and are used in a wide variety of applications. In control cabinet cooling, beer coolers, cooling cabinets, wood-burning stoves, medical devices – all have different requirements for resistance to environmental conditions. ACmaxx and GreenTech EC tubaxial fans offer the same features for moisture protection, splash water, and tougher environmental conditions.

Particular design features of the GreenTech EC tubaxial fan (ACi 4400): GreenTech EC compact fan is more compact!

As large as existing AC fans – and not a bit larger. This is the greatest feature of the ACi 4400 GreenTech EC tubaxial fans. Even in the hub area, the fan does not differ from typical 119 x 119 x 38 mm AC fans. Out with the AC, in with the ACi 4400 GreenTech EC tubaxial fans – it’s that simple.

The GreenTech EC tubaxial fan is more efficient!

ACmaxx saves energy, and the GreenTech EC tubaxial fan generation saves even more. While an AC fan at 50 Hz can barely reach an overall efficiency of 5-6%, the ACmaxx makes it to about 20-25%. With the new ACi 4400 GreenTech EC tubeaxial fans, a remarkable level of up to 30% is reached. This is the result of the optimization of the entire package made up of the drive, electronics, AC/DC conversion, and aerodynamics. Thus the new GreenTech EC tubeaxial fan series boasts energy savings of almost 75% compared to the corresponding AC fan, thus providing significantly greater savings than the 40% level of the old AC 4300 generation.

The GreenTech EC tubaxial fan is quieter!

The ACi 4400 GreenTech EC tubaxial fan is quieter! Quieter than AC fans and quieter than the existing ACmaxx generation. The reason for this is the optimized aerodynamics and the drive, which is optimized for minimum structure-borne noise. Thus the fan is only half as loud at a comparable air performance, and is up to 6 dB(A) quieter at some operating points.

Speed independent of voltage and frequency

For the ACi 4400 GreenTech EC tubaxial fans, the speed, and thus the flow quantity and operating noise, are independent of the power supply and power frequency. Versions are available for 115 VAC with a voltage range from 85 to 132 VAC and 230 VAC with a voltage range of 195 to 265 VAC. Operation with DC voltage is also possible. Voltage fluctuations and frequency differences in the power system are compensated for automatically.
Particular design features of the ACmaxx:

**Prepared for all common AC voltages**
These models have a very wide voltage range from 85 to 265 VAC – the global voltage range, so to speak. This allows the fan to be used around the world, opening up large savings potentials. In addition to reduced logistics effort and stock keeping, worldwide availability is key. ACmaxx is compatible with every power supply and no switching is needed. From 85 to 265 volts and power frequencies of 50 and 60 Hz. Voltage fluctuations in the power system are automatically compensated for.

**Higher performance**
Unlike conventional AC technology, the state-of-the-art drive concept of this fan series is not linked to a fixed power frequency. This allows the motor speed to be increased over a wide range. Thus ACmaxx provides significantly greater air flow and significantly increased pressure.

**Greater flexibility**
The flexibility of ACmaxx is unique. With its intelligent features, ACmaxx can be adapted individually to the specific application: standby mode, overload mode at peak times, or night reduction all the way to temperature-controlled quiet operation are all possible. From speed monitoring to long-term function checks using an alarm or speed signal outputs, ACmaxx offers optional interfaces that allow you to monitor an operation easily and quickly.

You can find further information about these fan options in the "Fans specials" chapter, starting on page 175.
Or you can simply contact our application engineers to discuss your ideal ACmaxx or GreenTech EC tubeaxial fan.

Subject to change

– Not yet available
• Available

* Partially granted, partially in registration stage.

Please note that these special versions are not possible for all voltages and speeds, and not in all combinations.

The special versions are designed for specific customers and projects.

As a rule they are not available off the shelf and are tied to minimum volumes.

Please consult your customer support representative about the feasibility of your special variant.
Air performance measured according to ISO 5801.
Installation category A, without contact protection.

Noise: Total sound power level $L_{W}$ ISO 10302
measured on a hemisphere with a radius of 2 m.
Sound pressure level $L_{P}$ measured at 1 m distance
from fan axis.

The values given are applicable only under the specified
measuring conditions and may differ depending on the
installation conditions.

In the event of deviation from the standard configuration,
the parameters must be checked after installation!

For detailed information see http://www.ebmpapst.com/general conditions

Possible special versions:
(See chapter DC fans - specials)
- Speed signal
- Go / NoGo alarm
- Alarm with speed limit
- External temperature sensor
- Internal temperature sensor
- PWM control input
- Analog control input
- Moisture protection
- Salt spray protection
- Degree of protection: IP 65

Air performance measured according to ISO 5801, Installation category A, without contact protection.

Noise: Total sound power level \(L_{WA}\) ISO 10302 measured on a hemisphere with a radius of 2 m.

Sound pressure level \(L_{PA}\) measured at 1 m distance from fan axis.

The values given are applicable only under the specified measuring conditions and may differ depending on the installation conditions.

In the event of deviation from the standard configuration, the parameters must be checked after installation!

For detailed information see http://www.ebmpapst.com/general conditions
Highest energy efficiency: 0.03 - 0.045 W/m³/h free air (specific fan power).
Boost speed: 2 speed settings possible via boost function.
Vibration isolation: Reduced transmission of vibrations from motor to housing.
Intelligence: Can be expanded to include set value requirement and signal outputs as an option.

Examples of connections

Nom speed endurance
Boost via light switch

Example 2:
Nom speed via light switch
Separate boost switch

Example 3:
Simple connection
Nom speed without switching

Example 4:
Simple connection
Boost without switching

Scope of delivery
AC axial fans
**Product line**
The renowned ebm-papst AC fans are used when DC voltage is not available. The AC range of fans is based on experience gained from decades of development know-how, millions of units in series production, and the innovation competence of a world-wide technology pioneer.

In this catalog, we offer you the broad spectrum of our AC fans. In addition to complete systems, you will also find fans without external housing. They offer economic benefits whenever the air duct design can be integrated in the respective device.

**Variety of sizes**
AC fans are available in a variety of sizes with either air exhaust or air intake over struts. Silent running models with sleeve bearings. Electrical connection with plug connection or external exposed connection wires are available.

**Shaded-pole or capacitor motors**
Fan drives by shaded-pole or capacitor motors, most of which incorporate the world-famous ebm-papst external rotor principle. The fan blades are directly attached to the external rotor of the external rotor motor. This construction combining high performance with profitability.

**Flat built AC fans**
ebm-papst also has AC fans with a particularly flat construction and an internal rotor motor. Their advantage: quick start to full speed. A plastic impeller and the smaller and lighter internal rotor motor result in lower rotational inertia.

**Bearings**
AC fans with sleeve bearings are powered by Class E insulated motors. Fans with ball bearings are equipped with Class B, E, or F insulated motors.

**Degree of protection**
All ebm-papst fans conform to the requirements of IP 20. IP 54 / IP 65 and special degrees of protection are available on request.

**AC voltage**
The line of AC fans for Euro voltage according to IEC 60038 (230 V ± 10 %) is also available in 115 V.

**Frequencies**
AC fans can be operated at frequencies of 50 or 60 Hz. In this case, their technical data changes accordingly.

**Capacitor**
Fans driven by capacitor external motors provide particularly high operating efficiency. Generally, the required motor run capacitor is already integrated in the fan housing.

**Overloading**
Almost all AC fans are protected against overloading (e. g. due to locked rotor) – either impedance protected (marked “Impedance protected” or “Z. P.”) or equipped with a thermal switch (marked “Thermally protected” or “Th. P.”). The model designation of these fans ends with “S”.

- Material:
  Housing: Die-cast aluminum
  Impeller: painted sheet steel
- Direction of air flow: Exhaust over struts
- Direction of rotation: Clockwise, looking towards rotor
- Connection:
  Via 2 single wires
  grounding lug for M4 x 8
  490 g
- Weight:
- Note:
  Please note our ACmaxx series.
  With identical mounting dimensions and voltages, this series achieves greater energy efficiency.
  See page 196.

---

**Material:**
- Housing: Die-cast aluminum
- Impeller: painted sheet steel
**Direction of air flow:** Exhaust over struts
**Direction of rotation:** Clockwise, looking towards rotor
**Connection:**
- Via 2 single wires
- grounding lug for M4 x 8
- Weight: 490 g

---

**Possible special versions:**
(See page 10)
- Moisture protection
- Salt spray protection
- Degree of protection: IP 54 / IP 65

---

The air flow and sound level of fans without external housing depend on the installation conditions. The stated air flow and noise have been measured with an orifice 76.5 mm Ø at a distance of approx. 17 mm from the mounting bracket. The air flow capacity of fan series 8000 N is achievable because of the exceptionally favorable installation conditions. The noise in the optimal operating range can be measured for these fans only in a specific application.
Air performance measured according to: ISO 5801.
Installation category A, without contact protection.
Noise: Total sound power level $L_{W,A}$ ISO 10302 measured on a hemisphere with a radius of 2 m.
Sound pressure level $L_{p,A}$ measured at 1 m distance from fan axis.
The values given are applicable only under the specified measuring conditions and may differ depending on the installation conditions.
In the event of deviation from the standard configuration, the parameters must be checked after installation!

Subject to change

Note:
Please note our ACmaxx series.
With identical mounting dimensions and voltages, this series achieves greater energy efficiency.
See page 198.

---

Air performance measured according to ISO 5801.
Installation category A, without contact protection.
Noise: Total sound power level $L_{WA}$ ISO 10302 measured on a hemisphere with a radius of 2 m.
Sound pressure level $L_{PA}$ measured at 1 m distance from fan axis.
The values given are applicable only under the specified measuring conditions and may differ depending on the installation conditions.
In the event of deviation from the standard configuration, the parameters must be checked after installation!
For detailed information see http://www.ebmpapst.com/general conditions.
AC axial fans

- Material: Die-cast aluminum
- Impeller: painted sheet steel
- Intake over struts
- Types 4890 N and 4840 N
- Exhaust over struts
- Direction of rotation: Clockwise, looking towards rotor
- Via 2 flat plugs 2.8 x 0.5 mm grounding lug for M4
- Weight: 550 g
- Available as an option: Versions with reinforced mounting flanges and exposed external single wires.
- Possible special versions:
  - Speed signal
  - Moisture protection
  - Salt spray protection
  - Degree of protection: IP 54 / IP 65

Subject to change.

The air flow and sound level of fans without external housing depends on the installation conditions.
The stated air flow and noise have been measured with an orifice 109 mm Ø at a distance of approx. 17 mm from the mounting bracket.
The air flow capacity of fan series 4000 Z is achievable because of the exceptionally favorable installation conditions. The noise in the optimal operating range can be measured for these fans only in a specific application.

Fan type | Connection wires

Air performance measured according to ISO 5801.
Installation category A, without contact protection.
Noise: Total sound power level $L_{WA}$ measured on a hemisphere with a radius of 2 m.
Sound pressure level $L_{PA}$ measured at 1 m distance
from fan axis.
The values given are applicable only under the specified measuring conditions and may vary depending on the installation conditions.
In the event of deviation from the standard configuration, the parameters must be checked after installation!
For detailed information see http://www.ebmpapst.com/general conditions.
Air performance measured according to: ISO 5801. Installation category A, without contact protection.

噪声: 总声功率级 $L_{wA}$ 按国际标准测量在半球面内半径为 2 m。

声压级 $L_{pA}$ 在 1 米距轴径测量。

值只适用于指定的测量条件，且根据安装条件可能不同。

在偏离标准配置的情况下，参数必须在安装后重新检查！

AC centrifugal fans

AC centrifugal fan overview
AC centrifugal fans
AC centrifugal fans

**Product line**
The renowned ebm-papst AC fans are used when DC voltage is not available. The AC range of fans is based on experience gained from decades of development know-how, millions of units in series production, and the innovation competence of a world-wide technology pioneer.

In this catalog, we offer you the broad spectrum of our AC fans. In addition to complete systems, you will also find fans without external housing. They offer economic benefits whenever the air duct design can be integrated in the respective device.

**Variety of sizes**
AC fans are available in a variety of sizes with either air exhaust or air intake over struts. Silent running models with sleeve bearings. Electrical connection with plug connection or external exposed connection wires are available.

**Shaded-pole or capacitor motors**
Fan drives by shaded-pole or capacitor motors, most of which incorporate the world-famous ebm-papst external rotor principle. The fan blades are directly attached to the external rotor of the external rotor motor. This construction combining high performance with profitability.

**Flat built AC fans**
ebm-papst also has AC fans with a particularly flat construction and an internal rotor motor. Their advantage: quick start to full speed. A plastic impeller and the smaller and lighter internal rotor motor result in lower rotational inertia.

**Bearings**
AC fans with sleeve bearings are powered by Class E insulated motors. Fans with ball bearings are equipped with Class B, E, or F insulated motors.

**Degree of protection**
All ebm-papst fans conform to the requirements of IP 20. Fans conforming to IP 54 / IP 65 and special degrees of protection are also available on request.

**AC voltage**
The line of AC fans for Euro voltage according to IEC 60038 (230 V ± 10 %) is also available in 115 V.

**Frequencies**
AC fans can be operated at frequencies of 50 or 60 Hz. In this case, their technical data changes accordingly.

**Capacitor**
Fans driven by capacitor external motors provide particularly high operating efficiency. Generally, the required motor run capacitor is already integrated in the fan housing.

**Overloading**
Almost all AC fans are protected against overloading (e.g. due to locked rotor) — either impedance protected (marked “Impedance protected” or “Z. P.”) or equipped with a thermal switch (marked “Thermally protected” or “Th. P.”). The model designation of these fans ends with “S”.

1) Fiberglass-reinforced plastic.

The air flow and sound level of the centrifugal fans without external housing depend on their individual installation conditions. The stated air flow and noise levels have been measured under the following conditions:

- Centrifugal fan mounted on a base plate 220 x 220 mm.
- Cover plate 220 x 220 mm with an air inlet of Ø 86 mm, concentric to the impeller.

Noise: Total sound power level L\(_W\) ISO 10302 measured on a hemisphere with a distance of 2 m. Sound pressure level L\(_p\) ISO 10302 measured at 1 m distance from fan axis. The values given are applicable only under the specified measuring conditions and may differ depending on the installation conditions.

The values are given only under the specified measuring conditions. In the event of deviation from the standard configuration, the parameters must be checked after installation!

The air flow and sound level of the centrifugal fans without external housing depend on their individual installation conditions. The stated air flow and noise levels have been measured under the following conditions:

Centrifugal fan mounted on a base plate 260 x 260 mm.
Cover plate 260 x 260 mm with an air inlet of Ø 100 mm, concentric to the impeller.

Air performance measured according to ISO 5801.
Installation category A, with ebm-papst inlet ring without contact protection.
Noise: Total sound power level \(L_{W, A}\) ISO 10302 measured on a hemisphere with a distance of 2 m.
Sound pressure level \(L_{p, A}\) measured at 1 m distance from fan axis.
The values given are applicable only under the specified measuring conditions and may differ depending on the installation conditions.
In the event of deviation from the standard configuration, the parameters must be checked after installation! For detailed information see http://www.ebmpapst.com/general conditions.
ebm-papst offers a comprehensive selection of accessories for optimum fan operation, from temperature sensors for speed-controlled fans, to finger guards for all variants, to cables, filters, and screens, to spacers and installation parts. Even in the case of very special parts, you can be sure: We will assist you every way possible. The sales experts at ebm-papst will be happy to assist you with your question concerning fan installation and use.

From selection to accessories:
Insist on the efficient and reliable service provided by ebm-papst.
Finger guards

- **Material:** Galvanized or nickel-plated steel wire
- **Note:** Finger guard according to DIN EN ISO 13857 (previously EN 294). Additional finger guards that do not satisfy DIN EN ISO 13857 available on request.

Our finger guards are designed specifically to be used with ebm-papst fans. They combine the highest degree of safety with minimum effect on the operating noise. Please note that the safety-related clearances cannot be guaranteed when finger guards made by other manufacturers are used.

The table below shows a selection of finger guards available in various sizes and types:

Finger guards
ACmaxx / ACi

- **Material:** Galvanized or nickel-plated steel wire
- **Note:** Finger guard according to DIN EN ISO 13857 (previously EN 294). Finger guards for air outlet described on this page are specifically for fan series ACmaxx. For air intake side the standard finger guards with a corresponding dimension can be used.

All measurements are given in mm.
**Filter fan guards**

- **Material:** Guard cover: Injection-molded polycarbonate (PC) with mat surface.
  Mounting plate: wire mesh with black powder coating
  Filter pad: white, synthetically bonded fibers

- **Note:**
  Filter fan guards suitable for fitting on axial fan series in sizes: 60 mm, 80 mm, 92 mm, 119 mm, ø 172 mm. All filter units fit directly on the existing mounting holes of the fans.
  Filter fan guards consisting of 3 parts: external guard cover, internal mounting plate, and replaceable filter pad.
  The filter pad can be replaced quickly and easily via a quick release on the guard cover.
  The filter pads can be replaced even while the fan is running, as protection is provided by the welded wire mesh.

* Replacement filter available only in packages of 5.

All measurements are given in mm.

**Filter performance**
The filter fan guard filters 75% of dust particles with a size of 5-10 microns and can withstand temperatures of up to 100 °C. Filter class G3 according to DIN EN 779. Flame-retardant according to DIN 53438, class F1. When a clean filter is installed, a reduction of air flow of 20-30 % is possible.
## Finger guards
For compact centrifugal modules

- **Material:** PA plastic, fiberglass-reinforced
- **Highlights:** Flame protection class in line with UL 94V-0

- Design: Cable conforms to UL standards sealed plug. Customized cables on request.

Jacketed cable, internal cables (UL style 2464/1061) 3 x AWG20 (approx. 0.5 mm²)

Wire end splices

- Easy speed programming
- Battery operated
- User-friendly navigation menu
- Protective cover with folding stand

For Energy Saving Motor (ESM) based products

Subject to change

Makes quick work of programming the two ESM adjustable operating speeds. Eliminates the need for a PC, software adapter and second cable. Especially for use in production or by sales representatives. Automatic shut-off function for extended battery life.

Mini USB plug for downloading software updates. Batteries, programming cable, and operating instructions included in scope of delivery.
In addition to the accessories and installation parts listed here, ebm-papst also supplies a number of additional, sometimes very special parts for fans. Our company sales team is happy to offer you their expert assistance with all your questions regarding the installation and use of our fans.

- **LZ212**: Screw clip of rustproof spring steel. For mounting fans with threaded pin 3.5 DIN EN ISO 1478 (7970).
- **LZ261**: Spacer of fiberglass-reinforced plastic. For mounting with screws through both fan mounting flanges.
- **LZ210**: Screw clip of hardened steel. For mounting fans with threaded pin 6-32 UNC or 3.5 DIN 7970.

- **LZ370**: Temperature sensor for speed-controlled fan operation. Temperature range 30...50 °C.
- **LZ550**: Rubber anti-vibration mounts for fans with a hole diameter of 4.3 ±0.2 mm and flange thickness of 3 to 5.5 mm. For a carrier plate with a hole diameter of 6.5 ±0.15 mm and plate thickness of 1 to 2 mm.
- **LZ551**: Rubber anti-vibration mounts for fans with a hole diameter of 4.3 ±0.2 mm and flange thickness of 2 to 4 mm. For a carrier plate with a hole diameter of 4.4 ±0.15 mm and plate thickness of 1 to 2 mm.
